EP021 Energy Efficiency

Molecular Products undertakes to monitor and report on an annual basis our energy usage (gas and electricity). This will allow patterns of energy usage to be detected.

Molecular Products will ensure that appropriate measures are taken to ensure that energy is used efficiently in the operation of the installation. This will include switching off machinery, lighting when not required. Process equipment will also undergo maintenance to ensure that these are operating efficiently.

Every 4 years Molecular Products will carry out a review of the activities to examine if there are any opportunities to improve the energy efficiency. This review will be documented within the Environmental Management system.

Further appropriate actions will be taken following the recommendations of a review.
