

In the first instance we would expect operators to discharge to the sewer. Provide full justification as to why a sewer connection is not considered feasible.

Discharge to the sewer would be our preferred option too.

The remote rural location of the site make this problematic.

We have approached Anglian Water who operate the nearest Sewage Treatment Plant at Stone Street approximately 1 mile from site, discussions with Anglian Water indicate that the plant is far too small to cope with the effluent from our site. They have also indicated that there is insufficient room for expansion in that plant. There are currently no drains between our location and the sewage works.

This was not a cost based conversation but more to do with capacity and potential to increase capacity on their part.
