

## Surface Water Management

This document provides details of surface water management at Lotus Car's anodising plant in Wellingborough.

The site's surface water consists of uncontaminated rainwater run-off from the roofs of the site's buildings and carpark. Due to the concrete hardstanding across the carpark, all rainwater run-off collects in a central gulley (see image below) from which it exits the site and enters the surface water drainage system.

Due to the uncontaminated nature of the rainwater run-off, there are no interceptors within the surface water drainage system on site and no treatment is undertaken prior to it leaving site.

The route is identified on the site's drainage plan (DR19-679 Plan 2) and the emission point is identified on the site plan as S2 (New Site Plan)
