DUST/BIOAEROSOL MANAGEMENT PLAN

There are no sensitive receptors within 100m of the boundary.

The main possible dust/bioaerosol sources are listed below:

- 1. Feed delivery
- 2. Feeding systems
- 3. Bedding material
- 4. Litter management
- 5. Ventilation systems
- 6. Stock inspections/management
- 7. Cleaning operations
- 8. Bird numbers

The flowing table describes how these sources are controlled

Possible dust	Process	Reduction	Completion
source		technique	date
Feed	Feed delivery to silos	All bulk deliveries in sealed and covered trailers. Discharged directly into silos through sealed pipe work. Silo vent pipes covered with containment bags.	In place
	Feeding systems	Feed delivered to sheds via sealed auger system and dropped directly to feed pans inside.	In place
	Feed spillage	Any feed spillages cleared up and disposed of immediately.	In place
	Process		Completion date
Feed	Feed type	All feed is pelleted and coated to prevent break up and dust production Some rations	In place

within sheds carried
out in a quiet
steady manner to
reduce bird
disturbance.

This plan will be reviewed every four years unless a problem occurs in the meantime.

Should dust emissions become an issue, further mitigation measures, such as screening will be investigated/implemented.
