1 Executive Summary

1.1 The Acoustics, Noise and Vibration Team at Savills has been appointed by Thurrock Power Limited (TPL) to undertake a noise impact assessment to support an 'Environmental Permit' (EP) application for a power generation facility (gas engines with associated plant). The facility will be constructed on land to the north of Tilbury substation and southwest of Station Road in Thurrock, Essex.

1.2 From a noise emissions perspective, the primary source of noise associated with the operation of the facility would be the gas engines themselves. Whilst these will be enclosed in concrete structures, providing significant attenuation, there will be necessary ventilation inlets and outlets where internal noise would 'break out'. The other primary noise source will be the external radiators, which will provide the cooling required. Other more minor sources of noise include the exhaust stacks and ductwork and associated transformers.

1.3 Noise emissions from the site will be controlled through the selection of quiet plant and inclusion of physical mitigation measures (engine enclosures, attenuated louvres, stack silencers). Due to technical and spatial constraints (cooling demand required and area of site respectively), it is not feasible to include additional techniques. In this regard, all appropriate preventative measures have been applied to minimise noise pollution and hence 'best available techniques' (BAT) have been demonstrated in accordance with the requirements of the Environmental Permitting Regulations.

1.4 Maximum Rating Levels at noise sensitive receptor locations, i.e. when the facility is producing maximum power generation, would be up to 4, 8 and 10 dB above the representative background sound levels during the daytime, evening and night-time periods, respectively.

1.5 However, due to low reasonably low Rating Levels and resultant ambient sound levels not noticeably changing or being of a magnitude likely to increase the risk for annoyance in external amenity areas or sleep disturbance, it is considered that significant adverse impacts would not occur.

1.6 Furthermore, the risk for adverse impact during night-time periods is significantly reduced as, based on operational experience of other similar facilities, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over a year, would the facility operate, i.e. 3% of the night-time period on average. Also, Rating Levels would often be lower than considered, reflecting the reduced power demand.

1.7 Consequently, when considering the operation of the facility over the entire year period, the resulting site noise impact would be minor adverse to adverse at all NSRs for all time periods. However, on the basis that significant adverse impacts would be avoided, and adverse impacts minimised, the proposed development would comply with the 'Noise Policy Statement for England', which sets out the long term overarching vision of Government noise policy.

2 Introduction

2.1 The Acoustics, Noise and Vibration Team at Savills has been appointed by Thurrock Power Limited (TPL) to undertake a noise impact assessment to support an 'Environmental Permit' (EP) application for a power generation facility (gas engines with associated plant). The facility will be constructed on land to the north of Tilbury substation and southwest of Station Road, Thurrock, Essex.

2.2 From a noise emissions perspective, the primary source of noise associated with the operation of the facility would be the operation of the gas engines themselves. Whilst these will be enclosed in concrete structures providing significant attenuation, there will be necessary ventilation air intake modules and air outlet attenuators, where internal noise would 'break out'. The other primary noise source will be the external radiator cooling units. Other more minor sources of noise include the exhaust stacks and ductwork, and associated transformers.

2.3 Whilst the facility will potentially operate on a 24/7 basis, it is envisaged to primarily only operate during peak periods of electricity demand or to prevent system instability. This would most typically be for a period ranging from one to seven hours per day, between 08:00 and 20:00 hours. However, there is the potential that the facility could be required to operate during a major power shortage or system stress events (e.g. a Notification of Inadequate System Margin) at any time of the day or night. It should be noted that the likelihood of the facility being required to start up at night is extremely low as peak electricity demand does not occur overnight.

2.4 Based on operational experience of other similar facilities, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over a year, would the facility operate, i.e. 3% of the night-time period on average.

2.5 The assessment has been undertaken based upon information on the proposed development provided by the project team and their experience of operating similar sites. The assessment considers potential adverse noise impacts affecting the nearest 'noise sensitive receptors' (NSRs) to the proposed development site. The assessment has been undertaken following a baseline noise survey and desktop assessment.

2.6 As the facility is a new development and is not currently constructed/operational, no previous surveys or assessments for operational noise have been completed.

2.7 The technical content of this assessment has been provided by Savills personnel, all of whom are corporate members, i.e. Member (MIOA) or Fellow (FIOA), of the Institute of Acoustics (IOA), the UK's professional body for those working in acoustics, noise and vibration. The assessment has been undertaken with integrity, objectivity and honesty in accordance with the Code of Conduct of the IOA.

2.8 The Team is also a member of the Association of Noise Consultants (ANC) which seeks to raise the standards of acoustic consultancy and improve recognition of the vital role which good acoustics, and the management and mitigation of noise and vibration play in achieving good design and effective planning in the built and natural environment. Membership of the ANC indicates that the Team is sufficiently competent to pass the high standards for entry to the association.

2.9 This report and assessment has been peer reviewed within the Savills team to ensure that it is technically robust and meets the requirements of our Integrated Management System.

2.10 Personnel and individual qualifications are provided within the Quality Management table at the start of this report and in Appendix A in accordance with the requirement of Section 12 of British Standard (BS) 4142:2014+A1:2019 'Methods for rating and assessing industrial and commercial sound' (BS 4142) [1].

3 Site, Area and Baseline Acoustic Environment

Site Layout & Noise Sources

3.1 Figure 3.1 below shows the current proposed site layout. The gas engine enclosures (gensets) are grouped, typically with two engine exhausts feeding into one main stack (exit point will be at 20 m above ground level). Radiators are located on the roof of the enclosures, in addition to ventilation outlets. Ventilation inlets are located on the ends of the enclosures.

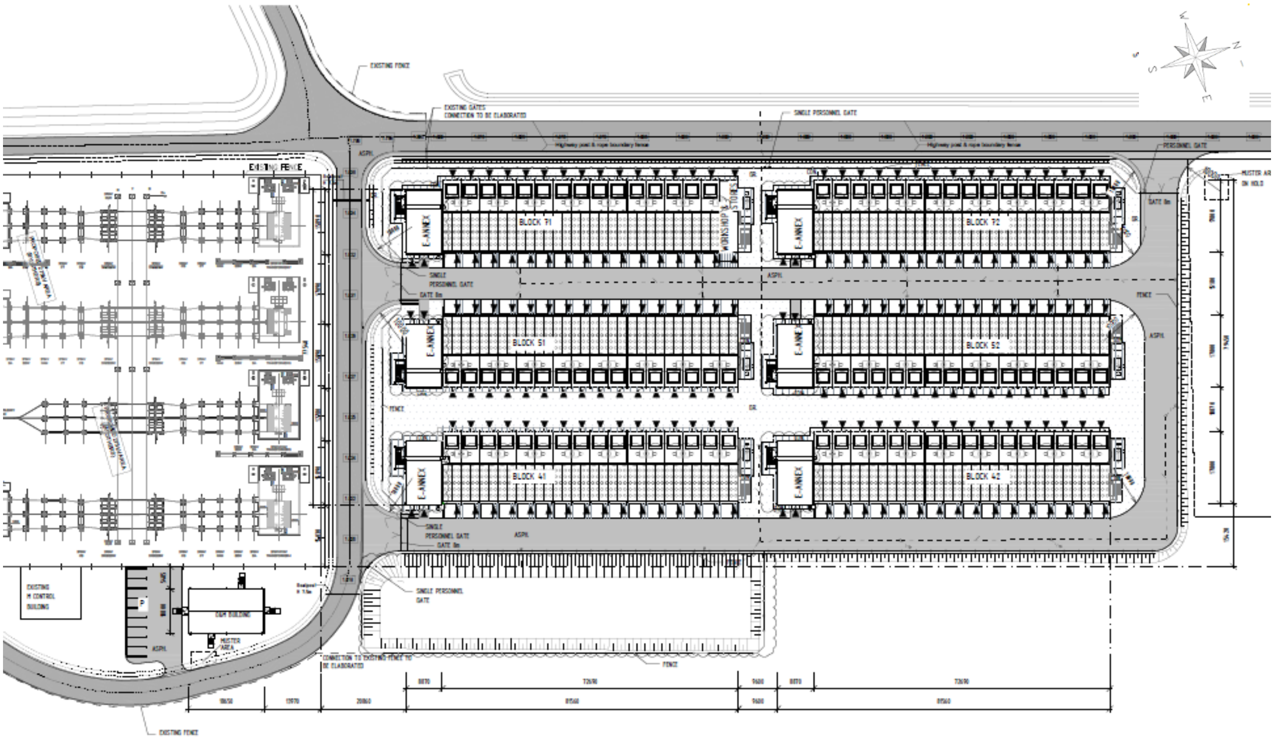

Figure 3.1: Site Layout & Noise Sources

Site and Wider Area

3.2 Figure 3.2 below shows the overall facility boundary and genset installation area, wider area and identified NSRs. Also identified are the locations of baseline sound level monitoring (LT1 to LT7), undertaken in February 2018. Further surveys at locations LT1, LT2 and LT3 were undertaken in June and July 2024, as detailed below.

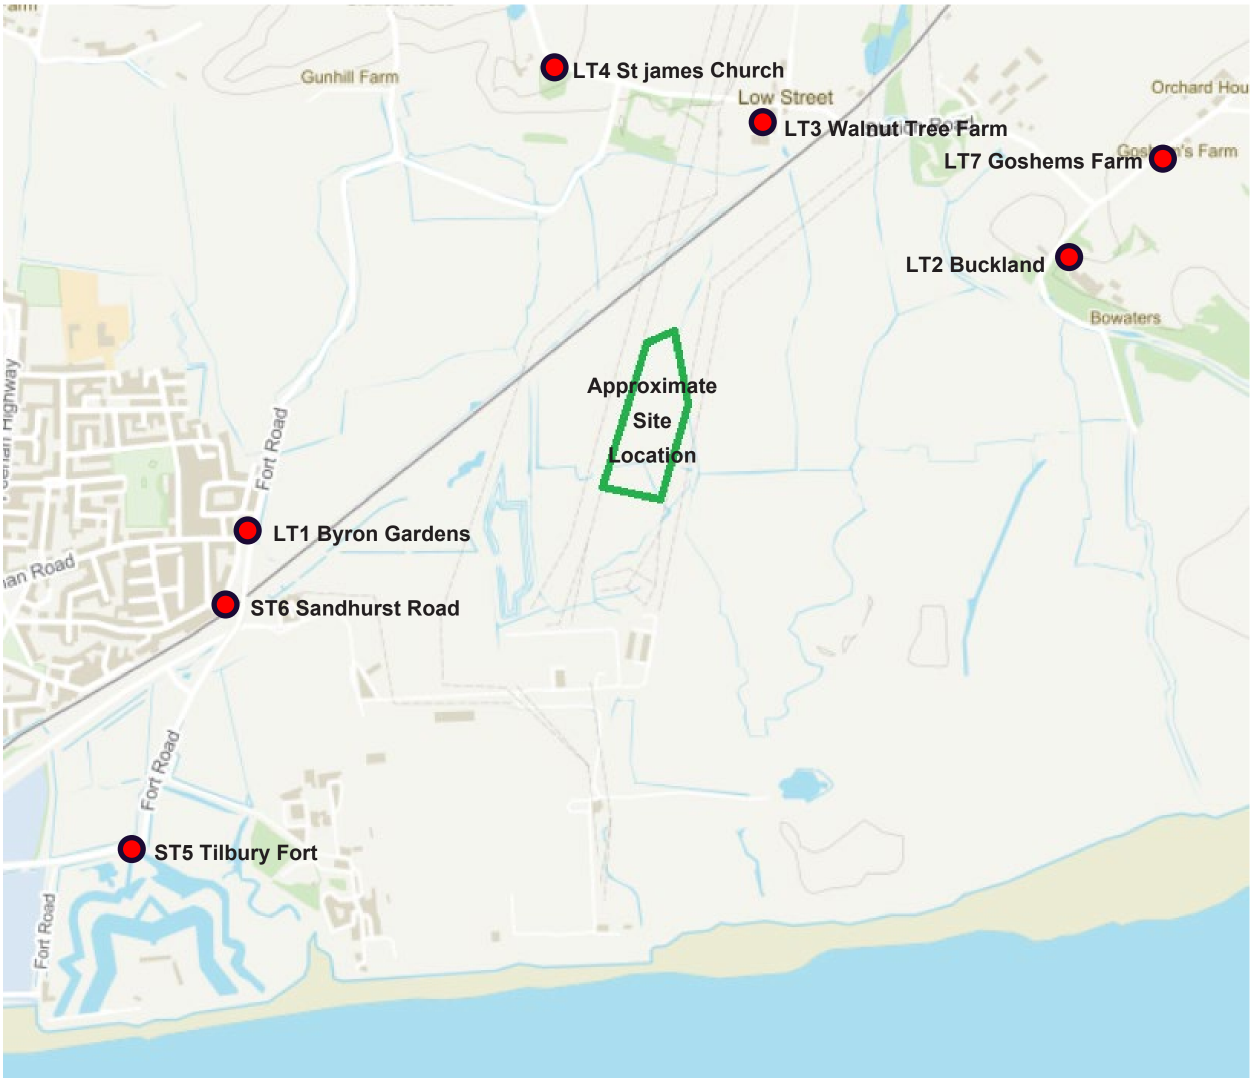

Figure 3.2: Site, Wider Area and Baseline Sound Level Monitoring Locations

3.3 The site of the proposed facility is on land to the north of the existing Tilbury substation.

3.4 The ground type between the site and the nearest NSRs is soft, open ground (grass fields, foliage etc.), with some hard ground (roads, railways etc.) with an increasing number of intervening structures further from the site.

Baseline Conditions

2018 Baseline Surveys

3.5 In order to establish baseline acoustic conditions at NSR locations to inform the original 2018 Development Consent Order' (DCO) application, five long term (19-day) unattended sound level surveys were undertaken in February 2018, together with two short-term surveys.

3.6 Full details of the baseline surveys undertaken are include in Appendix B. Information includes survey locations (including photos), observations, equipment details (serial numbers etc.), meteorological conditions, graphical time histories and statistical analysis.

2024 Baseline Surveys

3.7 In order to establish baseline acoustic conditions at the nearest NSR locations to the site and to determine if the acoustic environment has changed in the intervening period, baseline sound level data (LT2 and LT3) have been obtained from National Highways regarding the 'Lower Thames Crossing' (LTC) project, for which unattended sound level surveys have been ongoing since 2023. Data have been provided by the LTC Team for the 207 day period between 01 October 2023 and 25 April 2024.

3.8 LT2 is deployed at Norrskern at 4 m above ground in a free field position, approximately 500 m east of the site boundary and in the same location as the original 2018 LT2 survey. This location is also consider to be representative of Buckland, located approximately 70 m to the east[1].

3.9 LT3 is deployed at Havers Lodge at 4 m above ground in a free field position at a position approximately 240 m to the north of the site boundary and 150 m west of the original 2018 LT3 survey location at Walnut Tree Farm[2].

3.10 In both cases, the microphone is mounted at 4 m above ground level in a free-field position (at least 3.5 m from any reflecting surface, excluding the ground) using a Class 1 Svantek 307 sound level meters (SLM) in accordance with BS 7445-2:1991 'Description and measurement of environmental noise Part 2: Guide to the acquisition of data pertinent to land use' [2]. The SLM was set to log the A-weighted broadband sound pressure level (SPL) in 125 ms. Raw data have been post processed into 5-minute periods.

[1] Savills has visited the LT2 survey location in 2024 and the following noise sources were noted as affecting the acoustic environment: distant road traffic movements, use of machinery on land to the south, distant industry (metal recycling facility), rustling trees and occasional aircraft.

[2] Savills has visited the LT3 survey location in 2024 and the following noise sources were noted as affecting the acoustic environment: distant road traffic movements, use of machinery on land to the south, distant industry (metal recycling facility), rustling trees and occasional aircraft.

3.11 In addition to the above, Savills has undertaken additional long term unattended monitoring at a third location (LT1) between Thursday 27 June 2024 and Thursday 04 July 2024.

3.12 LT1 was deployed at Sandhurst Road, approximately 870 m to the south-west of the site boundary and 90 m south of the original 2018 LT1 survey location on Byron Gardens.

3.13 The microphone was mounted at 1.8 m above ground level in a free-field position (at least 3.5 m from any reflecting surface, excluding the ground) using a Class 1 NSRT Mk3 sound level meter (SLM) in accordance with BS 7445-2:1991 ‘Description and measurement of environmental noise Part 2: Guide to the acquisition of data pertinent to land use’. The SLM was set to log the A-weighted broadband sound pressure level (SPL) in 125 ms. Raw data were post processed into 15 minute periods.

3.14 At the time of setting up and collecting the LT1 survey, the following noise sources were noted as affecting the acoustic environment: regular road traffic movements on Fort Road and Brennan Road, occasional aircraft overhead and local pedestrians.

3.15 The equipment calibration level for each measurement was checked with a Rion NC-75 handheld calibrator to 94.0 dB prior to and after the monitoring period; no significant deviation (i.e. above 0.5 dB) was noted.

3.16 Meteorological conditions were monitored with a Luft WS600-UMB Smart Weather Sensor, deployed at the location of LT2. The LT1 survey period (Thursday 27 June 2024 and Thursday 04 July 2024) was largely dry with only one period of rain and wind speeds were low at all times (below 5 m/s). As such, sound level data logged during the period of rain have been removed from the subsequent analysis. However, it should be noted that comparison of the complete dataset with dataset with the periods of rain removed, shows only a negligible difference of less than 1 dB and only for some metrics.

3.17 With regard to the LT2 and LT3 survey data, as this has been obtained over a 207 day period, no data have been removed in the subsequent analysis.

3.18 Raw data, time histories, equipment details (serial numbers, calibration certificates etc.) and photos of survey locations are provided in Appendix C.

4 Methodology

Assessment Methodology

4.1 In accordance with Environment Agency (EA) guidance, this assessment has been undertaken based on the methodology detailed in BS 4142, a summary of which is provided below.

4.2 BS 4142 primarily provides a numerical method by which to determine the significance of sound of a commercial and/or industrial nature, i.e. the 'specific sound', at NSR locations.

4.3 The specific sound level may then be corrected for the character of the sound, if appropriate, and is then termed the 'Rating Level' whether corrections are made or not.

4.4 The commentary to paragraph 9.2 of BS 4142 suggests the following subjective methods for the determination of the rating penalty for tonal, impulsive and/or intermittent specific sounds:

"Tonality

For sound ranging from not tonal to prominently tonal the Joint Nordic Method gives a correction of between 0 dB and +6 dB for tonality. Subjectively, this can be converted to a rating penalty of 2 dB for a tone which is just perceptible at the noise receptor, 4 dB where it is clearly perceptible, and 6 dB where it is highly perceptible.

Impulsivity

A correction of up to +9 dB can be applied for sound that is highly impulsive, considering both the rapidity of the change in sound level and the overall change in sound level. Subjectively, this can be converted to a penalty of 3 dB for impulsivity which is just perceptible at the noise receptor, 6 dB where it is clearly perceptible, and 9 dB where it is highly perceptible.

Intermittency

When the specific sound has identifiable on/off conditions, the specific sound level should be representative of the time period of length equal to the reference time interval which contains the greatest total amount of on time. … If the intermittency is readily distinctive against the residual acoustic environment, a penalty of 3 dB can be applied.

Other sound characteristics

Where the specific sound features characteristics that are neither tonal nor impulsive, nor intermittent, though otherwise are readily distinctive against the residual acoustic environment, a penalty of 3 dB can be applied."

4.5 The Rating Level is then compared to the background sound level, which should be representative of the period being assessed.

4.6 The approach that has been adopted for this project is based on unattended surveys to obtain 15-minute values of $L_{A90,T}$ for a continuous period of at least 1-week at each assessment location. Representative background sound levels for the daytime and night-time periods have been derived from a combination of statistical data analysis; review of the temporal variations of sound and meteorological data throughout the survey period; and professional judgment supplemented by aural and visual observations of the acoustic environment at the survey locations.

4.7 Only data that were measured when the wind speeds were at or less than 5 m/s were included in the dataset used to derive the baseline noise levels. The standard indicates that measurements can be taken in wind speeds up to 5 m/s, i.e. it states *"Exercise caution when making measurements in poor weather conditions such as wind speeds greater than 5 m/s"*. It is considered that, by only using data obtained when wind speeds are at or less than 5 m/s, data will be obtained that is valid in this respect in accordance with BS 4142.

4.8 An initial estimate of the impact of the specific sound is obtained by subtracting the representative background sound level from the Rating Level.

4.9 Typically, the greater this difference, the greater is the magnitude of the impact:

- A difference of around +10 dB or more is likely to be an indication of a significant adverse impact, depending on the context.
- A difference of around +5 dB is likely to be an indication of an adverse impact, depending on the context.

4.10 The lower the rating level is relative to the representative background sound level, the less likely it is that the specific sound source will have an adverse impact or a significant adverse impact. Where the rating level does not exceed the background sound level, this is an indication of the specific sound source having a low impact, depending on the context.

4.11 The significance of the effect of the noise in question should be determined on the basis of the initial estimate of impact significance from the BS 4142 assessment with reference to the examples of outcomes described within the PPG-N and after having considered the context of the sound. It is necessary to consider all pertinent factors, including:

- the absolute level of sound;
- the character and level of the residual sound compared to the character and level of the specific sound; and
- the sensitivity of the receptor and whether dwellings or other premises used for residential purposes will already incorporate design measures that secure good internal and/or outdoor acoustic conditions.

Noise Propagation Methodology

4.12 As the facility is not yet operational, specific sound levels associated with operation of the facility at NSR locations have been predicted using a 3D sound model, built using SoundPLAN v9.0 noise modelling software.

4.13 The model predicts sound levels under light down-wind conditions based on hemispherical sound propagation with corrections for atmospheric absorption, ground effects, screening and directivity based on the procedure detailed in ISO 9613-2:1996 'Acoustics - Attenuation of sound during propagation outdoors - Part 2: General method of calculation' [3].

4.14 Note this has recently been superseded by BS ISO 9613-2:2024 'Acoustics — Attenuation of sound during propagation outdoors Part 2: Engineering method for the prediction of sound pressure levels outdoors' [4]; however this is not yet implemented in the software.

5 Noise Monitoring Data and Predictions

Representative Baseline Sound Levels

5.1 Tables 5.1 to 5.3 and Figures 5.1 to 5.3 below provide a tabular and graphical summary of the 5- and 15-minute baseline sound levels measured at LT1, LT2 and LT3 respectively, for the daytime (07:00 to 23:00 hours), evening (19:00 to 23:00 hours) and night-time (23:00 to 07:00 hours) periods. Note that the figures only show background sound levels.

5.2 BS 4142 requires that the background sound levels adopted for the assessment are representative of the period being assessed. However, the Standard states that there is no 'single' background sound level that can be derived from such measurements. It is particularly difficult to determine what is 'representative' of the night-time period because it can be subject to a wide variation in background sound levels between the beginning and end of the night period, and the quieter middle part of the night period. The accompanying note states that *"a representative level should account for the range of background sounds levels and should not automatically be assumed to be either the minimum or modal value"*.

5.3 In this instance, for the daytime and evening periods, the 25th percentile levels of the long term survey data have been used to characterise the baseline sound environment at all NSRs.

5.4 This is not the lowest sound level encountered but is lower than that obtained using the average. It therefore represents somewhere in the range of lower sound levels that are likely to be encountered and provides a precautionary assessment. For 75% of the time, baseline sound levels will be higher than the 25th percentile levels. Use of the 25th percentile ensures that any periods when higher wind speeds (or other extraneous noise) could have affected the measured baseline sound levels do not unduly affect the analysis.

5.5 With regard to the 2023/2024 LT2 and LT3 survey data, as this has been obtained over a 207 day period, no data logged during periods of precipitation or high wind has been removed from the statistical analysis. However, as the analysis considers the lower quartile of data. obtained over a substantially long period, it is considered that this provides a very representative view of the prevailing acoustic environment at the two survey locations, allowing for a robust assessment to be undertaken.

5.6 For the night-time period, the 50th percentile levels of the long term survey data have been used to characterise the baseline sound environment at all NSRs.

5.7 This on the basis that night-time operation of the power generation facility would be generally very limited (around 3% of the night time period) and would be very much more likely to occur during the morning shoulder period, in the hour or so before 07:00 hours, when potential demand would be highest. During these periods, the background sound level is higher than during the quietest period of the night, typically 02:00 to 04:00 hours. As such, if using the 25th percentile value, background sound levels would be skewed to this period, when the facility is unlikely to be in operation. It should still be noted that, for 50% of the time, background sound levels would be higher.

5.8 This is indicated below on the time history chart for LT1, which shows that, during the morning shoulder period, the background sound level is approximate 3 to 7 dB higher than the lowest level occurring at around 03:00 hours (further data in Appendix B).

5.9 Representative baseline residual levels have been based on the 50th percentile level, i.e. the median value.

Comparison with Historic 2018 Baseline Data

5.11 Tables 5.7 and 5.8 below provide a summary of the representative background and residual sound levels at survey location LT1, LT2 and LT3 as measured in 2024 and 2018. Further details of the 2018 data are provided in Appendix B.

Table 5.7: 2024 and 2018 Representative Background Sound Levels

Period	LT1: Byron Gardens (dB $L_{A90,T}$)			LT2: Buckland (dB $L_{A90,T}$)			LT 3: Havers Lodge (dB $L_{A90,T}$)		
	2018	2024	Delta	2018	2024	Delta	2018	2024	Delta
Day	40	39	*-1*	38	40	*+2*	42	42	*0*
Eve	36	35	*-1*	34	36	*+2*	36	38	*+2*
Night	39	34	*-5*	35	37	*+2*	37	40	*+3*

Table 5.8: 2024 and 2018 Representative Residual Sound Levels

Period	LT1: Byron Gardens (dB $L_{Aeq,T}$)			LT2: Buckland (dB $L_{Aeq,T}$)			LT 3: Havers Lodge (dB $L_{Aeq,T}$)		
	2018	2024	Delta	2018	2024	Delta	2018	2024	Delta
Day	62	59	*-3*	48	49	*+1*	57	51	*-6*
Eve	56	53	*-3*	42	41	*-1*	49	46	*-3*
Night	50	49	*-1*	39	40	*+1*	44	44	*0*

5.12 With reference to Tables 5.7 and 5.8 above, representative baseline sound levels are broadly comparable as measured in 2028 and 2023/2024 at all three surveys locations and for all three time periods. It should be noted that survey location LT3 was located in closer proximity to the road in 2018 compared to 2024 and this is the reason for the significantly lower residual sound level, particularly during the daytime period.

5.13 Nevertheless, in 2018 an addition to the above locations was surveyed, St James' Church (LT4), which, given the proximity to survey location LT3 (490 m to the east) and similar acoustic environment at both locations (as previously determined in 2018), a similar change to the 2018 baseline sound levels have been applied to the measured levels in 2024.

5.14 On the basis of the above, Table 5.9 below provides the representative baseline sound levels that have been used in the subsequent assessment.

Table 5.9: Representative Baseline Sound Levels

Location	Period	Background Sound Level $L_{A90,T}$ (dB)	Residual Sound Level $L_{Aeq,T}$ (dB)
LT1	Daytime[1]	39	59
	Evening[2]	35	53
	Night-time[3]	34	49
LT2	Daytime	40	49
	Evening	36	41
	Night-time	37	40
LT3	Daytime	42	51
	Evening	38	46
	Night-time	40	44
LT4	Daytime	41	48
	Evening	35	44
	Night-time	41	41

Notes:
1.Daytime 07:00 to 19:00 hours.
2.Evening 19:00 to 23:00 hours.
3.Night-time 23:00 to 07:00 hours

Comment

5.15 It is acknowledged that night-time background sound levels are the same or higher than the evening. This is considered to be reasonable on the basis that the facility is more likely to operate at the shoulder periods of night when demand is highest, associated with increased general activity resulting in higher background sound levels.

5.16 It should also be noted that all locations and for all periods, background sound levels are low and are about 30 dB $L_{A90,T}$ for LT2, LT3 and LT4 which, for the 1997 version of BS 4142, was considered to be very low.

5.17 The adopted representative survey locations for the nearest affected NSRs to the facility are presented in Table 5.10, below. These NSRs have been identified as the likely most affected receptors during the operation of the facility.

Table 5.10: Adopted Representative Survey Locations for NSRs

NSR	Representative Survey Location
Byron Gardens	LT1
Gun Hill Farm	LT4
Galsworthy Road	LT1
Havers Lodge	LT3
Buckland	LT2
St James' Church	LT4
Clarendon Road	LT3

Specific Sound Level Predictions

5.18 The externally located noise generating aspects of the facility include 95 genset enclosures (with capacity for up to 96), albeit these are generally located directly adjacent to each other and are not individually positioned.

5.19 Each enclosure has an associated ventilation air intake module at low level and air outlet attenuator at roof level. Also at roof level are the cooling radiators.

5.20 Each enclosure/genset has associated exhaust ductwork which feeds into an attenuated stack with a discharge point (at 20 m AGL). Generally, two gensets are grouped into one stack.

5.21 Model input data and manufacturer's data sheets (where available) are provided as Appendix D and are summarised below.

Gensets

5.22 Each genset has a 'sound power level' (SWL) of 126 dBA L_W. Based on the dimensions of the genset enclosures, the internal reverberant sound pressure level would be 112 dBA L_{Pi}[3]. Each genset is housed in a concrete enclosure (48 dB R_w).

5.23 On this basis, the resultant façade radiating SWL is 65 dBA L_W per unit area, with each enclosure then having an effective total SWL of 89 dBA L_W. Octave band data have been provided by the manufacturer. The genset enclosures have been modelled as industrial buildings with four radiating facades and a roof.

Radiators

5.24 Each genset has two associated radiators located above the roof level of the enclosure. Each radiator has a SWL of 90 dBA L_W and these have been modelled as area sources above the genset enclosures.

Ventilation Air Intake Modules

5.25 Each genset enclosure has a ventilation air intake module at low level. Based on a similar gas engine scheme and the acoustic design requirements for this project, the SWL of these modules is 86 dBA L_W. These have been modelled as vertical area sources (4 x 4 m).

Air Outlet Attenuators

5.26 Each genset enclosure has a ventilation air intake module at roof level. Based on a similar gas engine scheme and the acoustic design requirements for this project, the SWL of these outlet attenuators is 89 dBA L_W. These have been modelled as four vertical area sources, each with a SWL of 83 dBA L_W.

Exhaust Stacks

5.27 Each individual genset has an exhaust, with two exhausts feeding into a single silenced stack, which terminates at 20 m AGL. Each silenced exhaust outlet (two engine exhausts) has a SWL of 84 dBA L_W (73 dBA L_p at 1 m). A standard stack directivity has been applied.

Exhaust Ductwork

5.28 Exhaust ductwork at the exit point from the enclosures to the exhaust stakes has been modelled as line sources with a unit length SWL of 70 dBA L_W per unit length. This is based on data measured at similar other facilities and accounts for lagging materials that are fixed to the ductwork.

[3] 17.6 x 4.8 x 4 m. $L_p = L_W - 10\log(V) + 10\log(T) + 14$, assumed 0.5 s T

Gas Pressure Regulator Skid

5.29 The Gas Pressure Regulator Skid (PRS) has been modelled as a point source with a SWL of 93 dBA L_W, typical for a PRS (85 dBA L_p at 1 m).

Transformers

5.30 Transformers have been modelled as point sources at 1 m AGL.

5.31 The following assumptions have been incorporated into the noise model:

- the topography of the site and the surrounding area has been obtained from publicly available data sources;
- the effect of screening from solid structures (buildings) has been incorporated into the modelling process by importing OS Open Data 'Settlement Area' shape file data into the model and publicly available data; and
- the ground type in the model has been set G=1 hard for the site and soft (G=0) for the surrounding area.

5.32 On the basis of the above, Table 5.11 below provides a summary of modelled maximum specific sound levels at the nearest NSRs. Specific sound levels are at 1.5 m from facades in free field equivalent locations and at 1.5 and 4 m AGL.

5.33 Figure 1 at the end of the report provides a graphical presenting of noise levels at 4 m AGL.

5.34 It should be noted that the specific sound levels presented below are on the basis that the facility would be providing maximum power, with all plant in operation at 100% design capacity, i.e. a 'worst case' scenario in terms of noise. Typically, demand would be lower and noise emissions would be correspondingly reduced as a result. For example, if half the demand is required, specific sound levels would be 3 dB lower.

Table 5.11 Predicted Maximum Specific Sound Levels

NSR	Specific Sound Level $L_{Aeq,Tr}$ (dB)	
	1.5 m AGL	4 m AGL
Byron Gardens	43	44
Gun Hill Farm	41	42
Galsworthy Road	40	41
Havers Lodge	44	44
Buckland	40	41
St James' Church	42	43

Rating Levels

5.35 With reference to BS 4142, a character correction can be applied to the specific sound level depending on the acoustic characteristics of the sound at the assessment location, including corrections for impulsivity, tonality, intermittency or other distinctive character.

5.36 In this case, it has not been considered appropriate to apply any correction for Scenarios 1 and 2 at any assessment/NSR location. This is on the basis that:

1. The specific sound would not be impulsive or intermittent, rather it would be on at least for a full assessment period (1-hour during the daytime, 15-minutes during the night-time), potentially gradually ramping up/down at any one time.
2. Based on professional experience, whilst the radiators incorporate a fan, with potential for tonal emissions, the surrounding parts of the coolers (grilles etc.) act to provide a masking sound such that the resulting emissions are more broadband/aerodynamic and *'whooshing'* in nature.
3. As it is considered that the only source of tonal noise from the proposed development is from the transformers and the contribution from this source to the overall specific sound is negligible, it is unlikely that noise levels at the nearby NSRs would be perceived or characterised as tonal.
4. The specific sound is broadband in nature and steady with little variation or unusual sound/features that might be considered incongruous or readily distinctive compared to the residual acoustic environment.

5.37 On the basis of the above, specific sound levels are equal to the Rating Levels at all NSRs.

Operating conditions

5.38 The development would operate during peak periods of electricity demand or to prevent system instability. Based on information provided at the planning and DCO stage, this would most typically be for a period ranging from one to seven hours, between 08:00 and 20:00 hours.

5.39 However, there is the potential that the proposed development could be required to operate during a major power shortage or system stress events (e.g. a Notification of Inadequate System Margin) at any time of the day or night. It should be noted that the likelihood of the facility being required to start up in the middle of the night is extremely low as peak electricity demand does not occur overnight.

5.40 On this basis, Figure 5.5 below shows an indicative typical pattern of average daily operating hours in each month of the year. A further breakdown of indicative typical operating hours at each time of the day during the winter, summer and annual periods is presented in Table 1.1. These breakdowns are based on data from similar operational peaking plant provided by the applicant; they are indicative of likely seasonal and diurnal cycles to inform the assessment of impacts, but are not the fixed operating hours of the proposed facility.

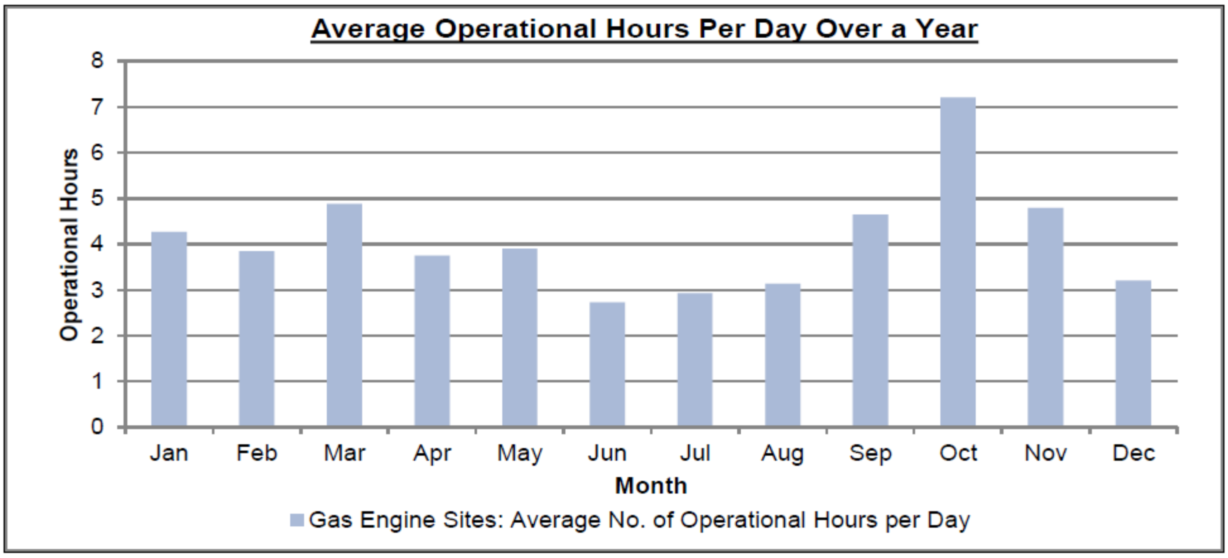

Figure 5.5: Site, Wider Area and Baseline Sound Level Monitoring Locations

5.41 As can be seen from Table 5.12, operational hours during night-time periods (23:00 to 07:00 hours) account for less than 2% of the total operating hours over the course of a year, at a similar peaking power facility site operated by the applicant. Significant night-time operation is therefore unlikely.

Table 5.12 Typical Daily Operating Times Breakdown of an Operational Peaking Plant

Period (hours)	Percentage total operational time (%)
04:00 to 07:00	2
07:00 to 16:00	41
16:00 to 19:00	44
19:00 to 23:00	12
23:00 to 07:00	0.2

6 Noise Impact Assessment

6.1 Tables 6.1, 6.2 and 6.3 below provide an initial estimate of the noise impact at the nearest NSRs for the daytime, evening and night-time periods, respectively. Note daytime and evening Rating Levels are at ground floor level (1.5 m AGL) and night-time at first floor level (4 m AGL).

Table 6.1 Daytime (07:00 to 19:00 hours) BS 4142 Numerical Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Rating Penalty, dB	Rating Level, dB $L_{Ar,Tr}$	Background Level, dB $L_{A90,T}$	Rating / Background Level Difference, dB

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Rating Penalty, dB	Rating Level, dB $L_{Ar,Tr}$	Background Level, dB $L_{A90,T}$	Rating / Background Level Difference, dB
St James' Church	43	0	43	41	+2

6.2 With regard to the rating/background level differences, BS 4142:2014+A1:2019 states:

- A difference of around +10 dB or more is likely to be an indication of a significant adverse impact, depending on the context;
- A difference of around +5 dB is likely to be an indication of an adverse impact, depending on the context; and
- The lower the rating level is relative to the measured background sound level, the less likely it is that the specific sound source will have an adverse impact or a significant adverse impact. Where the rating level does not exceed the background sound level, this is an indication of the specific sound source having a low impact, depending on the context.

6.3 On the basis of the above, and with reference to Table 6.1, it is considered that, during the daytime period there is a low risk that operation of the facility would result in adverse impact at NSRs, significant or otherwise, as Rating Levels are, at most, up to 4 dB above background.

6.4 With reference to Tables 6.2 and 6.3 during the evening and night-time periods, as rating Levels are up to 8 and 10 dB above background, there is a risk that operation of the facility would result in adverse or significant adverse impact at NSRs, depending on the context.

6.5 In this instance, it is considered that the context of the noise does reduce the risk for adverse impact at all NSRs, such that significant adverse impact would be unlikely to occur during all time periods as explained below.

6.6 Maximum Rating Levels of 39 to 44 dB $L_{Ar,Tr}$ are considered to be of a reasonably low magnitude (note that the 1997 revision of BS 4142 considered Rating Levels below 35 dB to be very low) and a magnitude on its own to unlikely to result in significant adverse impact regardless of the difference to the background sound level.

6.7 In this regard, BS 4142:2014 states:

"Where background sound levels and rating levels are low, absolute levels might be as, or more, relevant than the margin by which the rating level exceeds the background. This is especially true at night."

6.8 Considering absolute sound levels and the likelihood for impact, the addition of the maximum specific sound to the existing residual sound level would result in no more than a 1 and 2 dB increase in ambient sound level during the daytime and evening periods respectively. This change in ambient sound level is summarised in Tables 6.4 and 6.5 below

Table 6.4 Scenario 1: Daytime (07:00 to 19:00 hours) Ambient Noise Change Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Residual Sound Level, dB $L_{Aeq,T}$	Ambient Sound Level, dB $L_{Aeq,T}$	Change (dB)
Byron Gardens	43	59	59	0
Gun Hill Farm	41	48	49	+1
Galsworthy Road	40	59	59	0
Havers Lodge	44	51	52	+1
Buckland	40	49	50	+1
St James' Church	42	48	49	+1

Table 6.5 Scenario 1: Evening (19:00 to 23:00 hours) Ambient Noise Change Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Residual Sound Level, dB $L_{Aeq,T}$	Ambient Sound Level, dB $L_{Aeq,T}$	Change (dB)
Byron Gardens	43	53	53	0
Gun Hill Farm	41	44	46	+2
Galsworthy Road	40	53	53	0
Havers Lodge	44	46	48	+2
Buckland	40	41	44	+3
St James' Church	42	44	46	+2

6.9 For steady sources of a similar character, a +/-3 dB change is generally taken as the minimum change that is perceptible to most people. On this basis, as the specific sound would be steady, a change of +2 dB is not considered to be a significant increase and would likely not be noticeable.

6.10 Furthermore, the addition of the specific sound would not result in ambient sound levels increasing from below 50 or 55 dB $L_{Aeq,T}$ to above. On this basis, there would be no increase in the risk for the specific sound to increase the risk for annoyance in external amenity areas.

6.11 On the basis of the above, whilst the specific sound may be discernible during quite periods, when the facility is maximum power, it would not be of a magnitude to result in overall ambient sound levels noticeably increasing or increase the risk for annoyance.

6.12 It should also be noted that, at the most affected NSRs (St James' Church and Havers Lodge), distant industrial activity was observed as affecting the acoustic environment (as noted in Appendix B). As such, the new noise source would not be as discernible as it may otherwise be compared to the situation where industrial/commercial noise did not already affect the environment.

6.13 Furthermore, the above assessment is based on use of the 25th percentile of all background sound level data. As such, for 75% of the daytime and evening periods, background sound levels would be higher and the difference between the Rating and background sound levels, lower. For example, at the most affected NSR, St James' Church, during the daytime and evening periods for 50% of the time, the background sound level is 2 dB higher, such the Rating/background sound level difference would be +4 dB for the evening period.

6.14 Finally, it should be noted that the assessment above has been completed on the basis that the facility would be providing maximum power, i.e. a 'worst case' scenario in terms of noise. Typically, demand would be lower and noise emissions would be correspondingly lower as a result.

6.15 On the basis that maximum demand is more likely to occur during the daytime period, rather than the evening (or night-time, as detailed below), it is likely that Rating Levels during the evening would normally be lower. For example, if half the demand is required, Rating Levels would be 3 dB lower and no more than 3 dB above the evening 25th percentile background sound level and 1 dB above the evening 50th percentile background sound level.

Night-time

6.16 Similarly as for the daytime and evening periods, the maximum Rating Levels of 38 to 44 dB $L_{Ar,Tr}$ are considered to be of a reasonably low magnitude, and are considered to not be of sufficient magnitude likely to result in adverse impact, such as sleep disturbance, particularly as the sound would be steady with no impulsive or intermittent features.

6.17 With reference to the 'Guidelines for Community Noise' (GCN) [5] document, resultant ambient sound levels would be of a magnitude below that which sleep disturbance may result (45 dB $L_{Aeq,T}$) at all NSRs where the residual sound level is currently below that level, apart from the NSR Havers Lodge. This change in ambient noise level is summarised in Table 6.6 below.

Table 6.6 Scenario 2: Night-time (23:00 to 07:00 hours) Ambient Noise Change Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Residual Sound Level, dB $L_{Aeq,T}$	Ambient Sound Level, dB $L_{Aeq,T}$	Change (dB)
Byron Gardens	44	49	50	+1
Gun Hill Farm	42	41	45	+4
Galsworthy Road	41	49	50	+1
Havers Lodge	44	44	47	+3
Buckland	41	40	44	+4
St James' Church	43	41	45	+4

6.18 Whilst the Rating/background level difference is up to +10 dB during the night-time period, this relates to an external assessment location, whereas during this period residents are more likely to be inside dwellings, where associated sound levels would be lower. On the basis that the facades of dwellings will attenuate external sound by 12 to 20 dB, considered to be a reasonable assumption as partially open windows provide ~15 dB attenuation, appropriate internal sound levels for sleeping would be achieved (internal ambient sound levels <30 dBA), and sleep disturbance would be unlikely to result.

6.19 In addition to the low maximum Rating Level, a critical aspect reducing the risk for adverse impact during the night-time period is the very limited number of times and likely durations the facility would operate during the night-time period and, if in operation, whether maximum demand would be provided.

6.20 Based on operational experience of other similar facilities, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over the course of a year, would the facility likely be operational i.e. 3% of the night-time period on average. Such operation would likely be during the shoulder period (before 07:00 hours) when background noise levels are higher. The facility would be very unlikely to operate at the quietest part of the night (02:00 to 04:00 hours).

6.21 On this basis, whilst a +10 dB maximum Rating/background level difference, with a Rating Level of 44 dB $L_{Ar,Tr}$, may result in a moderate adverse impact if occurring for the whole, or majority of the night, if only occurring for 88-hours out of 2,920 night-time hours over the course of a year, the risk for long term impact is significantly reduced.

6.22 Furthermore, if only providing half the maximum demand, Rating Levels would be 3 dB lower and only 7 dB above the night-time background sound level.

6.23 Consequently, it is considered that night-time impacts, across a period of time, would be negligible at the majority of NSRs during the night-time period, albeit potentially minor impact may result at the most affected NSRs.

Summary

6.24 Maximum Rating Levels at NSR locations, i.e. when the facility is producing maximum power, would be up to 4, 8 and 10 dB above the representative background sound level during the daytime, evening and night-time periods, respectively.

6.25 However, due to low Rating Levels and resultant ambient sound levels not noticeably changing or being of a magnitude likely to increase the risk for annoyance in external amenity areas or cause sleep disturbance, it is considered that significant adverse impacts would not occur.

6.26 Furthermore, the risk for adverse impact during night-time period for is significantly reduced as for only 88 hours of the night-time period (23:00 to 07:00 hours) over the course of a year, would the facility likely be operational i.e. 3% of the night-time period on average. Also, Rating Levels would often be lower than considered, reflecting the reduced power demand.

6.27 Consequently, when considering the operation of the facility over the entire year period, the resulting site noise impact would be no greater than adverse, i.e. significant impacts/effects avoided at all NSRs for all time periods, as summarised in Table 6.7 below.

6.28 On the basis that significant adverse impacts would be avoided, and adverse impacts minimised (through the application of noise control methods/techniques detailed in Section 7) the proposed development would comply with the 'Noise Policy Statement for England' (NPSE) [6], which sets out the long term overarching vision of Government noise policy.

Table 6.7 Overall Site Noise Impact

NSR	Overall: Site Noise Impact		
	Daytime	Evening	Night-time
Byron Gardens	Negligible	Adverse	Adverse
Gun Hill Farm	Negligible	Minor	Negligible
Galsworthy Road	Negligible	Minor	Adverse
Havers Lodge	Minor	Adverse	Adverse
Buckland	Negligible	Minor	Negligible
St James' Church	Negligible	Adverse	Negligible

7 Noise Control

7.1 With reference to Section 6 above, operation of the facility over the entire year period would result in negligible to minor adverse noise impacts at all NSRs for all time periods.

7.2 However, this is based on the following application of noise control methods/techniques:

- the gensets housed in concrete enclosures;
- attenuation of the genset air inlets and outlets;
- silencers fitted to the genset exhausts; and
- location of plant away from NSRs.

7.3 Due to technical and spatial constraints, it is not feasible to select radiators with lower noise emissions or install the radiators differently, i.e. at low/ground level or be more enclosed.

7.4 On the basis of the above, all techniques have been employed to minimise noise emissions as far as reasonably practicable.

7.5 In this regard, the facility has applied all appropriate preventative measures taken to minimise noise pollution, in particular with the application of ‘best available techniques’ (BAT), in accordance with the Environmental Permitting Regulations.

7.6 A Noise Management Plan is include as Appendix E of the report.

8 Uncertainty

8.1 In all assessments, it is good practice to consider uncertainty which can arise from a number of different aspects. There are degrees of uncertainty associated with: instrumentation used for surveying; measurement technique and the variables influencing the measurement results such as transmission path and weather conditions; source terms used for modelling; calculation uncertainty; assessment uncertainty; and the subjective response of residents to noise sources.

8.2 Uncertainty due to instrumentation has been significantly reduced with the introduction of more modern instrumentation and is reduced further by undertaking field calibration checks on sound level meters before and after each measurement period with no significant drifty (less than 0.5 dB) and that all instrumentation is within accepted laboratory calibration intervals.

8.3 Every effort has been made to reduce the uncertainty of the baseline sound level measurements. The duration of the baseline survey is considered to significantly reduce the uncertainty associated with the baseline sound levels. Dat logged during periods of rainfall has been removed from the analysis. Based on professional judgement including substantial experience of acquiring and analysing baseline data for numerous sites in various locations, and a desk-based review of the site and surrounding area, it is considered that the baseline data acquired during the survey is typical of the area.

8.4 Representative baseline sound levels used in the assessment have been based on the 25% of all data logged, i.e. for 75% of the time, baseline sound levels are higher than used in the assessment. This approach will favour a reasonable ‘worst case’ scenario and a robust assessment to be completed. Representative baseline sound levels have been calculated for three accepted time periods daytime (07:00 to 19:00 hours), evening (19:00 to 23:00 hours) and night-time (23:00 to 07:00 hours).

8.5 For two survey and assessment locations, representative baseline sound levels have been derived through a statistical analysis of 207 days of data, a substantially long period.

8.6 Calculation uncertainty and assessment uncertainty have been reduced by peer review of all baseline data, model input data, model results and assessment calculations, and by using the appropriate level of precision at each stage of the assessment calculations.

8.7 With regard to the primary noise source, the 95 gensets (with capacity for up to 98) and radiators, acoustic and operational data has been provided by the manufacturer so it is considered there is minimal uncertainty with regard to this data. Acoustic data for the flue stack exhausts has been based on that provided by the silencer manufacture.

8.8 There are uncertainties in any prediction methodology. ISO 9613 Part 2 provides a method for predicting acoustic propagation outdoors. The method is applicable in practice to a great variety of sound sources and environments. It is applicable (directly or indirectly) to most situations including industrial sound sources, construction activities and many other ground-based sound sources. The estimated accuracy for values of the average downwind sound pressure level is stated as +/-3 dB for a mean source/receptor height of up to five metres and source/propagation separation distance of up to 1 km. For a mean source height between 5 and 30 m, the estimated accuracy is given as +/-1 dB for a source/propagation separation distance of 0 to 100 m and +/- 3 dB for a source/propagation separation distance of >100 m. This is a standard approach and is considered to be an acceptable prediction methodology.

8.9 Specific sound levels have been calculated at ground and first floor level for the daytime and night-time periods respectively, at locations of facades albeit in free-field locations.

8.10 Intervening structures between the site and NSR location and the ground type has been based on a review of mapping and site observations.

8.11 A quantitative assessment has been undertaken based on information provided by the project team for the proposed development and professional judgement based on recognised and accepted empirical calculation methodologies. Where assumptions have been made, these have been informed through assessment and visiting similar facilities and have favoured a worst-case scenario, allowing for a reasonable and robust assessment.

8.12 With regards to subjective response, the noise standards adopted for the assessment are based upon the subjective response of the majority of the population or will be based upon the most likely response of the majority of the population. This is considered to be the best that can be achieved in a population of varying subjective response which will vary dependent upon a wide range of factors.

8.13 All areas and potential consequences of uncertainty have been minimised at every stage of the assessment process. On the basis of the above, and in the context of subjective response, the effects of uncertainty on the assessment conclusions are considered minimal.

9 Summary and Conclusions

9.1 The Acoustics, Noise and Vibration Team at Savills has been appointed by TPL to undertake a noise impact assessment to support an 'Environmental Permit' (EP) application for a power generation facility (gas engines with associated plant). The facility will be constructed on land to the north of Tilbury substation and southwest of Station Road, Thurrock, Essex.

9.2 Noise emissions from the facility will be controlled through the application of noise control methods/techniques, including the gensets housed in concrete enclosures, attenuation of the genset air inlets and outlets and silencers fitted to the genset exhausts.

9.3 Maximum Rating Levels at NSR locations, i.e. when the facility is producing maximum power, would be up to 4, 8 and 10 dB above the representative background sound level during the daytime, evening and night-time periods, respectively.

9.4 Due to low Rating Levels and resultant ambient sound levels not noticeably changing or being of a magnitude likely to increase the risk for annoyance in external amenity areas or sleep disturbance, it is considered that significant adverse impacts would not occur.

9.5 Furthermore, the risk for adverse impact during night-time periods is significantly reduced as, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over the course of a year, would the facility likely be operational i.e.3% of the night time period on average. Also, Rating Levels would often be lower than considered, reflecting the reduced power demand.

9.6 Consequently, when considering the operation of the facility over the entire year period, the resulting site noise impact would be negligible adverse to adverse at all NSRs for all time periods.

9.7 All techniques have been employed within the design of the facility to minimise noise emissions as far as reasonably practicable. In this regard the facility has applied all appropriate preventative measures taken to minimise noise pollution, in particular with the application of 'best available techniques' (BAT), in accordance with the Environmental Permitting Regulations.

9.8 On the basis that significant adverse impacts would be avoided, and adverse impacts minimised, the proposed development would comply with the 'Noise Policy Statement for England' (NPSE), which sets out the long term overarching vision of Government noise policy.

Appendices

Appendix A: BS 4142 Statements

Phil Evans: Director - Acoustics

BSc (Hons) Geology; MSc Acoustics, Vibration and Noise Control; Fellow of the Geological Society; Fellow of the Institute of Acoustics; Associate Member Acoustical Society of America

A.1 Phil is a Director and leads the Savills Acoustics Team. He is a specialist in environmental acoustics and is active on a number of committees including the Association of Noise Consultants' Vibration Working Group; British Standards Institution (BSi) Committee GME/21/6/4 - BS 6472: Guide to Evaluation of Human Exposure to Vibration in Buildings; BSi Committee B/564/01 on BS 5228: Noise and Vibration Control on Construction and Open Sites which has now also revised and issued BS 8233:2014 Guidance on sound insulation and noise reduction in buildings. He has been a corporate Member of the Institute of Acoustics (MIOA) for over 20 years.

A.2 Phil has over 25 years' experience in the project management of, and technical input to, environmental noise and vibration impact assessments for major developments. He is an expert in the industrial/commercial, transportation and construction sectors including the measurement, calculation, evaluation and mitigation of environmental noise and vibration. Phil has significant experience in the preparation and presentation of technical evidence and reports for public inquiries and planning applications. He is experienced in consultation and liaison with government departments, local authorities and other statutory bodies. He is an experienced expert witness. He has a Continuous Professional Development Record to support this competency and experience.

A.3 Phil has been involved in many BS 4142 noise assessments for both the previous and current 2014 version of BS 4142. He has given evidence at public inquiries where BS 4142 has been the primary assessment methodology. He is very familiar with the Standard and attended the joint ANC/BSi launch of the 2014 version of the Standard. On the basis of Phil's overall experience in acoustics combined with particular focus on BS 4142, he is deemed competent for BS 4142 assessments.

A.4 For this project, Phil as taken on the role of Project Director and has been responsible for overseeing and delivering the project.

Peter Barling: Associate - Acoustics

BSc (Hons) Physics; PGDip Environmental Assessment and Management; Member of the Institute of Acoustics

A.6 Peter is an Associate Consultant in Acoustics and environmental acoustics specialist with over 10e years' experience. He has a Degree in Physics and also has a Post Graduate Diploma in Environmental Assessment and Management. He has been a member of the Institute of Acoustics since 2013.

A.7 Peter has project managed and undertaken noise assessments for a variety of developments, including: large scale mixed-use developments, incorporating commercial, retail, leisure and residential elements; on-shore substations for off-shore windfarms; energy from waste facilities; manufacturing facilities; distribution centres; retail units; minerals extraction and exploration; solar farms; and petrol service filling stations. He has provided input into Environmental Impact Assessments (EIAs) and undertaken noise assessments to support planning applications and discharge planning conditions. He has a Continuous Professional Development (CPD) Record to support this competency and experience.

A.8 Peter has undertaken BS 4142 noise assessments for both the previous and current 2014 version of BS 4142. He is familiar with the Standard and has attended and participated in internal and external CPD training seminars regarding the revised 2014 version of the Standard. On the basis of Peter's overall experience in acoustics, combined with particular focus on BS 4142, he is deemed competent for BS 4142 assessments.

A.9 Peter was responsible for undertaking the baseline acoustic survey, and preparation of the assessment and report.

Summary

This Appendix provides details of the baseline noise monitoring undertaken as part of the noise assessment, and in accordance with BS 4142:2014+A1:2019.

Qualifications

This document has been prepared by Josh Wilson, an Acoustic Consultant and full Member of the Institute of Acoustics, who has over four years' experience of environmental noise impact assessment.

It has been checked and authorised by Simon Stephenson, a Technical Director within the Acoustics Team and full member of the Institute of Acoustics, who has 20 years' experience of environmental noise impact assessment.

1. Introduction

1.1.1 RPS has been commissioned by Thurrock Power Ltd to undertake baseline noise monitoring to inform the noise impact assessment for a proposed flexible generation plant comprising gas engines and battery storage near Tilbury (the proposed development).

1.1.2 This report provides the results of baseline sound measurements undertaken to characterise the sound environment in the vicinity of the nearest Noise Sensitive Receptors (NSRs) to the proposed development including its potential road access and supply gas pipeline routes. These baseline levels will be used in the assessment of effects for the operational and construction noise and vibration assessments to be reported in the Preliminary Environmental Impact Report (PEIR).

1.1.3 Access to all survey locations was agreed with the landowners. The surveys were undertaken between Thursday 1st and Wednesday 21st February 2018.

1.1.4 This report provides a summary of the survey data for each survey location. As stated above, these levels will be relied upon within the assessment carried out for the PEIR. Survey sheets indicating details and locations of noise monitoring equipment are provided in Annex A.

2. Baseline Survey Methodology

2.1 Consultation with Local Planning Authority

2.1.1 The proposed approach to the baseline surveys was described in the Baseline Noise Monitoring Plan issued on 18 January 2018. The survey methodology was subject to consultation and was agreed to be appropriate by Mark Gentry, Environmental Health Officer for Thurrock Council.

2.2 Survey locations

2.2.1 Survey locations were chosen to characterise baseline conditions in the vicinity of the nearest noise sensitive receptors to the proposed development and based on their proximity to the site. The proposed monitoring were as follows:

- LT1 – Byron Gardens: This location is approximately 750 m west of the proposed development and is representative of the residential properties west of Fort Road. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- LT2 – Buckland: This location is approximately 1 km east-north-east of the proposed development and is representative of the residential properties in this area. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- LT3 – Walnut Tree Farm: This location is approximately 840 m north-north-east of the proposed development and is representative of the residential properties in this area. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- LT4 – St James Church: This location is approximately 1 km north of the proposed development and is representative of the church and town hall as well as the wider settlement of West Tilbury. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- ST5 – Tilbury Fort: This location is approximately 1.2 km south-west of the proposed development and is representative of the Fort which is controlled by English Heritage and operated as a tourist attraction. It is proposed to undertake short-term noise monitoring at this location during the daytime.
- ST6 – Sandhurst Road: This location is approximately 850 m west of the proposed development and is representative of the residential properties west of Fort Road but nearer to the railway line and existing industrial areas than those properties at Byron Gardens. It is proposed to undertake short-term noise monitoring at this location.
- LT7 – Goshem's Farm: This location is approximately 1.6 km north east of the proposed development and close to the potential gas connection compound and is representative of the residential properties in the area. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.

2.2.2 Table 2.1 provides a summary of the baseline survey locations and grid co-ordinates of where the survey equipment was positioned. All survey locations are identified in Figure 2.1 overleaf.

Table 2.1: Survey locations.

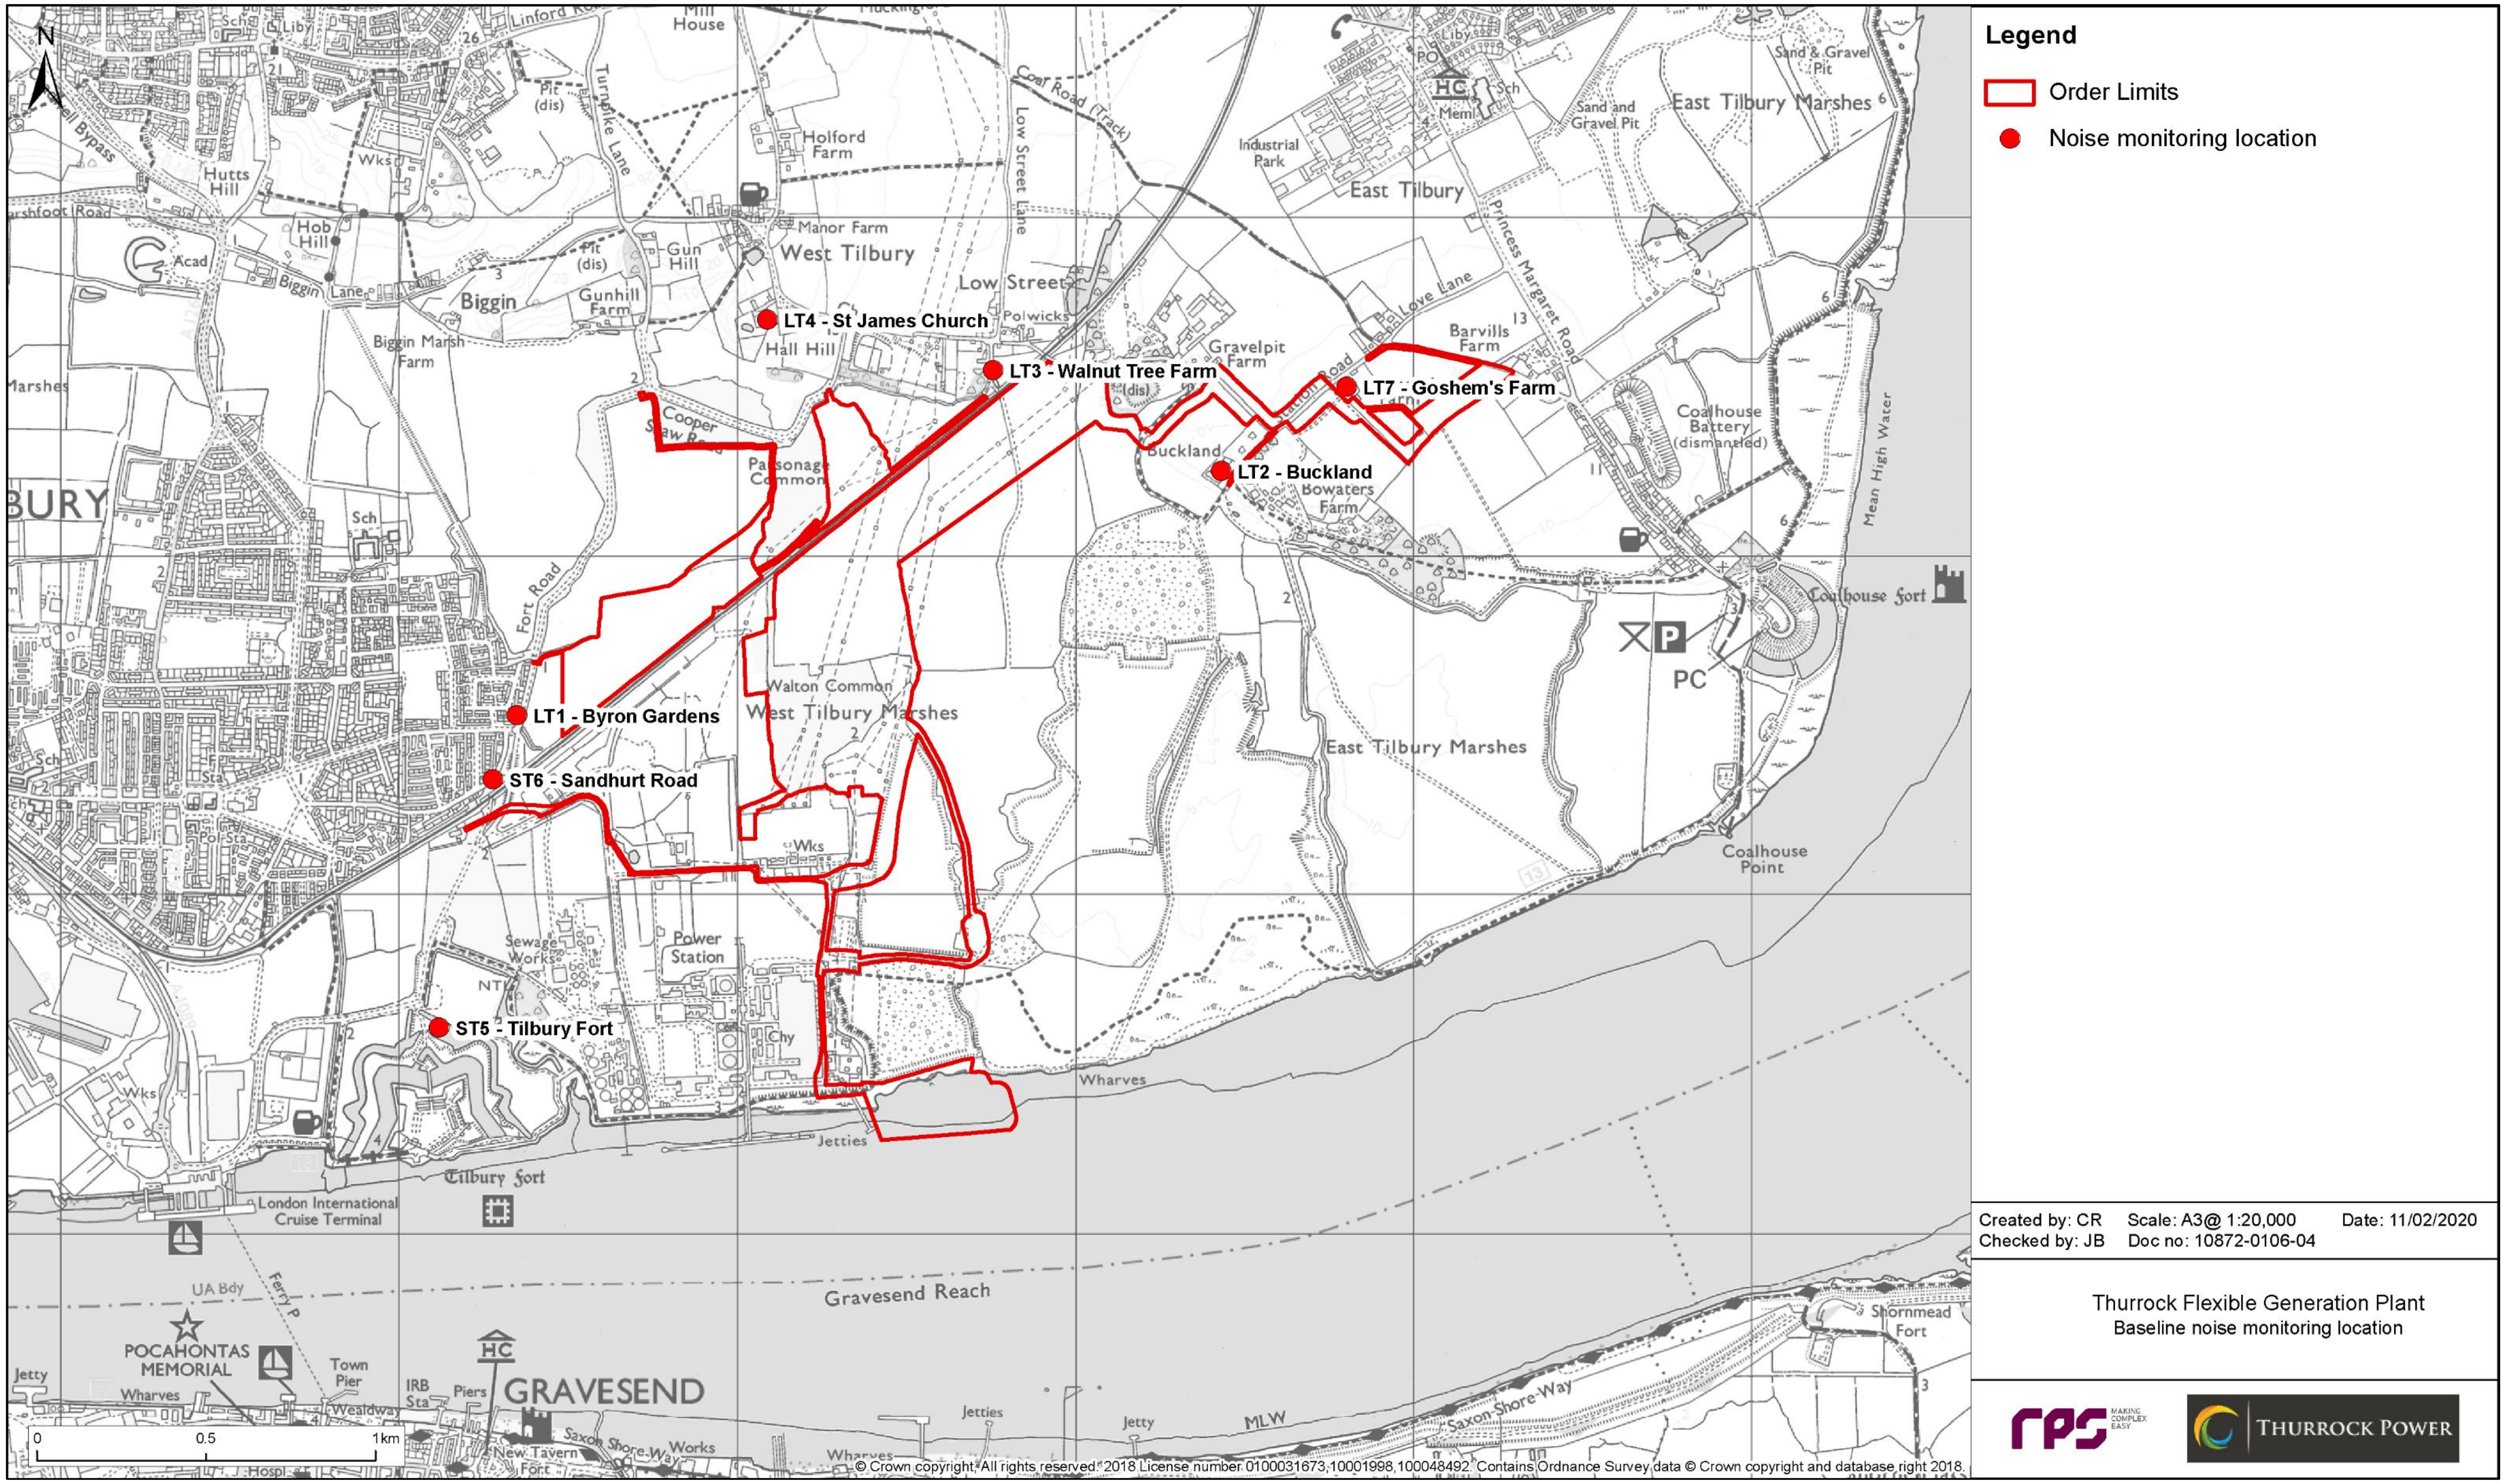

Figure 2.1: Baseline survey locations.

2.3 Baseline survey procedure

2.3.1 Long term unattended baseline sound level monitoring was undertaken between Thursday 1st and Wednesday 21st February 2018 at five locations in closest proximity to the proposed development. At each long term survey location, concurrent, short-term, attended surveys were carried out during the day (07:00 – 19:00 hours), evening (19:00 – 23:00 hours) and night-time (23:00 – 07:00 hours) periods. Attended short term surveys were also undertaken at two additional locations.

2.3.2 All sound level monitoring was carried out using one of the following 'Class 1' sound level meters (SLM): Rion NL-52, Rion NA-28 or Rion NL-31. Each SLM was checked for calibration prior to and immediately following the survey with no significant deviation found. At the long term monitoring locations, continuous data were logged of the fast time weighted, A-weighted, broadband sound pressure levels in 100 ms periods. Short-term attended survey data were logged of the fast time weighted, A-weighted, broadband sound pressure levels in 15 minute periods.

2.3.3 The long term surveys were established during the day and observations made of sources and other conditions in accordance with the requirements of British Standard (BS) 4142:2014+A1:2019 'Methods for rating and assessing industrial and commercial sound' (British Standards Institution (BSI), 2019). As a minimum, the following noise parameters were recorded; L_{Aeq}, L_{Amax}, L_{A10} and L_{A90}. Third octave band measurements were carried out at all locations, with the exception of ST6, to determine the frequency content of the baseline sound. It is considered that spectral data acquired at LT1 is representative of ST6.

2.3.4 In addition to each long term survey location, concurrent attended surveys were carried out during the day (07:00-1900), evening (19:00-23:00) and night-time (23:00-07:00) periods. Short-term attended surveys consisted of the following: three 15 minute discontinuous periods during the daytime; one 15 minute period during the evening; and three 15 minute periods during the night-time.

2.3.5 Long term surveys were undertaken following guidance contained in BS 7445 2:1991 'Description and measurement of environmental noise, Part 2: Guide to the acquisition of data pertinent to land use' (BSI, 1991).

2.3.6 Meteorological conditions were monitored during the long-term surveys with an unattended weather station installed at LT2. Average wind speeds did not exceed 5 m/s during the survey period. There were no significant periods of precipitation. Some limited light precipitation was recorded on 2nd February 2018 however this did not have a significant influence on the measured sound levels. Therefore no data have been excluded from the dataset due to adverse weather conditions.

2.3.7 Meteorological conditions were also measured during each short-term attended measurement using a hand held anemometer.

3. Baseline Survey Details and Results

3.1.1 Survey record sheets for each survey location detailing the position of the noise monitors are presented in Annex A. Time histories of the measured sound levels and meteorological conditions during the survey period are presented in Annex B. Results of the short term attended monitoring are presented in Annex C.

4. Discussion of Results

4.1 Determining representative baseline levels

4.1.1 To ascertain the typical sound levels at the measurement locations, time history plots have been produced and presented for each long term monitoring position. These are presented with the summary results tables in Annex B. The summaries of results in Annex B are based on analysis of the measured sound levels processed into 15 minute samples.

4.1.2 Representative baseline sound levels will be determined, where possible, from long-term monitoring survey locations. For receptor locations where long-term monitoring was not undertaken, the baseline sound levels will be determined from short-term survey data. The data obtained will be analysed and compared against other datasets in order to obtain a representative baseline sound level.

4.2 Operational noise assessment

4.2.1 BS 4142:2014+A1:2019 requires that the background sound levels adopted for the assessment be representative for the period being assessed. The Standard recommends that the background sound level should be derived from continuous measurements of normally not less than 15-minute intervals, which can be contiguous or disaggregated. However, the standard states that there is no 'single' background sound level that can be derived from such measurements. It is particularly difficult to determine what is 'representative' of the night-time period because it can be subject to a wide variation in background sound levels between the shoulder night periods. The accompanying note to paragraph 8.1.4 states that:

"a representative level ought to account for the range of background sounds levels and ought not automatically to be assumed to be either the minimum or modal value".

4.2.2 In determining representative baseline noise levels for receptors identified within the Environmental Statement, it will be necessary to analyse each location individually to ensure the most representative level is considered. BS 4142:2014+A1:2019 states that:

"In using the background sound level in the method for rating and assessing industrial and commercial sound it is important to ensure that values are reliable and suitably represent both the particular circumstances and periods of interest. For this purpose, the objective is not simply to ascertain a lowest measured background sound level, but rather to quantify what is typical during particular time periods."

4.3 Construction noise assessment

4.3.1 To determine the most representative ambient sound levels, the equivalent continuous A-weighted sound pressure level, L_{Aeq}, will be calculated based on standard construction hours and presented as a logarithmic average of the 15 minute period data over the relevant time periods.

Annex C Baseline Survey Results: Short Term Attended Measurements

Table 1: Short term attended measurements – LT1 Byron Gardens.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:47	2	W	7	60	4	1	2	4	1	67	88	71	53	45	0	Occasional but regular traffic on adjacent on Fort Road dominant and cause of LAmax levels (high % HGVs). Distant traffic audible. Distant industry audible.
01/02/2018 21:23	2	W	4	60	8	1	2	4	1	57	83	51	43	41	0	Very occasional but regular traffic on adjacent on Fort Road dominant and cause of LAmax levels (high % HGVs). Distant traffic, v. distant sirens and port activity, v. occasional local traffic, fence rattling. Train @ +5mins. Distant industry.
01/02/2018 23:01	3	W	5	60	6	1	2	3	3	46	69	50	40	38	0	Distant traffic, distant reverse alarm from port, distant aircraft, 2 trains, 1 passenger 1 long freight. Distant industry.
02/02/2018 00:08	3	W	5	60	3	1	2	3	3	45	73	42	38	37	0	Occasional freight train cause of LAmax levels. Distant traffic, distant aircraft. Distant industry.
02/02/2018 01:14	2	W	4	60	2	1	2	3	3	49	75	50	40	38	0	Wind, distant traffic, 2 freight trains cause of LAmax levels. Distant industry.
02/02/2018 10:26	3	W	6	60	6	1	2	4	1	59	80	59	48	44	0	Occasional but regular traffic on adjacent Fort Road dominant and cause of LAmax levels (high % HGVs). Wind rustle, distant aircraft, trains, local traffic, distant and local HGVs. Distant industry.
02/02/2018 11:30	3	W	6	60	7	1	2	4	1	61	81	60	47	42	0	Occasional but regular traffic on adjacent Fort Road dominant and cause of LAmax levels (high % HGVs). Road traffic local and distant, greater proportion of HGVs, voices, distant industry and aircraft, birds

*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant

C.1.1 Daytime ambient levels at LT1 were dominated by local road traffic movements on Fort Road, including a high percentage of HGVs. Night-time ambient levels were dominated by local road traffic movements and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industry. Daytime and night-time maxima affected by local road traffic and/or train movements.

Table 2: Short term attended measurements – LT2 Buckland.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 15:43	2	W	7	60	4	2	2	4	2	52	74	56	50	45	0	Metal recycling continuous, birds, vegetation
01/02/2018 22:12	2	W	4	60	8	1	2	3	1	46	68	49	43	41	0	Distant traffic, vegetation movement
01/02/2018 23:41	3	W	5	60	5	1	2	3	1	42	65	43	40	38	0	Distant traffic, vegetation movement
02/02/2018 00:49	3	W	5	60	2	1	2	3	1	39	58	40	37	36	0	Vegetation movement
02/02/2018 02:05	3	W	3	60	2	1	2	3	1	43	63	45	42	40	0	Vegetation movement
02/02/2018 11:08	3.5	W	6	60	6	2	2	4	2	53	66	56	51	47	0	Metal recycling continuously audible, distant traffic, vegetation
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.2 Daytime ambient levels at LT2 were primarily affected by local farming activity, occasional aircraft overhead and to some extent distant industry (metals recycling facility located on Station Road). Night-time ambient levels were primarily affected by distant traffic and industry. Daytime and night-time background levels were primarily affected by distant traffic and industry, and wind in flora. Daytime and night-time maxima affected by local road traffic and/or train movements.

Table 3: Short term attended measurements – LT3 Walnut Tree Farm.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	Wind Direction	Temperature, °C	Humidity, %RH	Cloud, Octants	Industry	Wind in flora	Road	Other (trains/aircraft)	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:34	2	W	7	60	4	2	1	4	1	56	76	60	46	41	0	Local road traffic on Church Road dominant with high % HGVs. Distant aircraft, birds. Quiet when traffic is low
01/02/2018 22:30	3	W	5	60	6	2	1	3	2	52	74	49	40	38	0	Occasional local road traffic movements (cars) on Church Road. Distant traffic, some local traffic, wind rustle, distant aircraft and industry
01/02/2018 23:21	3	W	5	60	6	1	1	3	2	52	78	41	38	37	0	Occasional local road traffic movements (cars) on Church Road. Distant traffic, v. occasional local traffic, vegetation movement. Train @ +2mins
02/02/2018 00:29	3	W	5	60	3	1	1	3	2	48	72	45	37	36	0	Occasional local road traffic movements (cars) on Church Road. Distant traffic, v. occasional local traffic, vegetation movement
02/02/2018 01:44	2	W	4	60	2	1	1	3	2	40	65	42	39	38	0	Occasional local road traffic movements (cars) on Church Road. Vegetation movement
02/02/2018 10:49	3	W	6	60	6	2	1	4	1	63	82	67	52	48	0	Local road traffic on Church Road dominant with high % HGVs. Road adjacent fairly busy, cars and HGVs. Traffic dominant
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.3 Daytime ambient levels at LT3 were dominated by local road traffic movements on Church Road, including a high percentage of HGVs. Night-time ambient levels were dominated by local road traffic movements on Church Road and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources. Daytime and night-time maxima affected by local road traffic on Church Road and/or train movements.

Table 4: Short term attended measurements – LT4 St James' Church.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms⁻¹	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:51	3	W	5	60	7	1	2	3	1	58	78	54	46	43	0	Distant traffic and aircraft, birds, occasional local traffic on Church Road
01/02/2018 21:51	2	W	4	60	8	1	2	2	1	45	61	46	44	42	0	Distant traffic, wind rustle, dog bark
01/02/2018 23:22	3	W	5	60	5	1	2	2	1	47	72	48	40	39	0	Fox, distant traffic, wind
02/02/2018 00:29	3	W	5	60	3	1	2	2	1	42	73	41	38	37	0	Distant traffic, v. distant industry
02/02/2018 01:47	2	W	4	60	2	1	2	2	1	43	74	42	40	39	0	Wind, light distant traffic
02/02/2018 10:45	3	W	6	60	6	1	2	3	1	58	78	57	47	45	0	Wind rustle, local on Church Road and distant traffic, birds, distant aircraft
02/02/2018 11:51	3	W	6	60	7	1	2	3	1	59	77	59	48	44	0	Wind rustle, local on Church Road and distant traffic, birds, distant aircraft
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.4 Daytime ambient levels at LT4 were primarily affected by local road traffic movements on Church Road and occasional aircraft. Night-time ambient levels were primarily affected by local and distant road traffic movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources, and wind in flora. Daytime and night-time maxima affected by local road traffic and/or aircraft.

Table 5: Short term attended measurements – LT5 Tilbury Fort.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:23	2	W	7	60	4	2	1	2	1	52	65	54	52	50	0	Largely distant road traffic, distant aircraft, distant voices, fence rattle with wind. Train @ +13mins
01/02/2018 17:21	2	W	6	60	8	2	1	2	1	52	69	53	52	50	0	Distant traffic, distant reverse alarm, wind, water, distant aircraft, barges
02/02/2018 09:55	3	W	6	60	6	2	1	2	1	52	66	54	51	49	0	Distant traffic and aircraft, port activity: engines, clanging, alarms
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.5 Daytime ambient and background levels at ST5 were primarily affected by local activity, distant traffic and industry. Daytime maxima affected by local activity and/or aircraft.

Table 6: Short term attended measurements – LT6 Sandhurst Road.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 17:10	3	W	5	60	7	2	1	4	1	50	66	53	47	45	0	Roads dominant, local and distant, distant aircraft, train @+7mins.
01/02/2018 21:44	2	W	4	60	8	2	1	4	1	50	73	51	44	43	0	Distant traffic, occasional local traffic on Sandhurst Road close to survey location and Fort Road, railway power lines humming. Train @ +2mins, +8mins.
01/02/2018 22:59	3	W	5	60	6	2	1	3	3	57	90	59	42	41	0	Distant traffic, occasional local traffic on Sandhurst Road close to survey location and Fort Road, railway power lines humming.
02/02/2018 00:06	3	W	5	60	4	2	1	2	3	41	68	42	40	39	0	Distant traffic, railway power lines humming.
02/02/2018 01:23	2	W	4	60	2	2	1	2	3	50	70	48	41	40	0	Railway power lines humming.
02/02/2018 10:26	3	W	6	60	6	2	1	4	1	53	71	55	47	45	0	Distant roads and aircraft, car idling nearby. Car alarm and train together @ +12mins.
02/02/2018 11:31	3	W	6	60	7	2	1	4	1	52	77	54	47	44	0	Distant roads and aircraft, occasional local traffic on Sandhurst Road close to survey location and Fort Road.
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.6 Daytime ambient levels at ST6 were dominated by local road traffic movements on Fort Road, including a high percentage of HGVs. Night-time ambient levels were dominated by local road traffic movements and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources. Daytime and night-time maxima affected by local road traffic and/or train movements.

Table 7: Short term attended measurements – LT7 Goshem's Farms.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:14	2	W	7	60	4	2	2	3	2	51	68	54	47	43	0	Metal recycling audible, local traffic, distant aircraft, birds
01/02/2018 22:10	2	W	4	60	8	1	2	2	2	50	76	48	40	38	0	Distant traffic, wind, distant industry (not metal recycling)
01/02/2018 23:44	3	W	5	60	4	1	2	2	2	44	73	45	40	37	0	Distant traffic, wind, distant industry(not metal recycling)
02/02/2018 00:52	2	W	4	60	2	1	2	2	2	39	65	40	36	34	0	Distant traffic, wind, distant industry (not metal recycling), distant train
02/02/2018 02:07	3	W	3	60	2	1	2	2	2	43	69	45	40	37	0	Distant traffic and industry (not metal recycling), wind
02/02/2018 11:07	3.5	W	6	60	6	2	2	3	2	60	83	57	48	44	0	Local traffic on Station Road (cause of LAmax levels) and metal recycling: metal clanging, reverse alarm. Distant traffic and aircraft, birds, trains
02/02/2018 12:11	3	W	6	60	8	2	2	3	2	62	84	60	48	44	0	Local traffic on Station Road (cause of LAmax levels) and metal recycling: metal clanging, reverse alarm. Distant traffic and aircraft, birds, trains
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.7 Daytime ambient levels at LT7 were primarily affected by local road traffic movements on Station Road, local commercial activity (vehicle service centre), and to some extent distant industry (metals recycling facility located on Station Road). Night-time ambient levels were dominated by local road traffic movements and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources, and wind in flora. Daytime and night-time maxima affected by local road traffic movements.

Photographs of Measurement Location

Description of site (location of equipment, general surroundings, nature of ground between NSR and sound source(s) (hard/ soft ground, topography, intervening features, reflecting surfaces))

LT1 was deployed at Sandhurst Road, approximately 870 m to the south-west of the site boundary and 90 m south of the original 2018 LT1 survey location on Byron Gardens.

Description of sound environment (principal environmental and natural sound sources, which sources are dominant, character of the sound environment cf. to the character of the new source)

At the time of setting up and collecting the LT1 survey, the following noise sources were noted as affecting the acoustic environment: regular road traffic movements on Fort Road and Brennan Road, occasional aircraft overhead, and local pedestrians.
