1 Executive Summary

1.1 The Acoustics, Noise and Vibration Team at Savills has been appointed by Thurrock Power 2 Limited and Statera Energy Limited to undertake a noise impact assessment to support an 'Environmental Permit' (EP) application for a power generation facility (gas engines with associated plant). The facility will be constructed on land adjacent to the existing 'Thurrock Flexible Generation Plant' (TFGP) development (Site 1) and is known as Site 2 (T2FGP).

1.2 From a noise emissions perspective, the primary source of noise associated with the operation of the facility would be the gas engines themselves. Whilst these will be enclosed in concrete structures, providing significant attenuation, there will be necessary ventilation inlets and outlets where internal noise would 'break out'. The other primary noise source will be the external radiators, which will provide the cooling required. Other more minor sources of noise include the exhaust stacks and ductwork and associated transformers.

1.3 Noise emissions from the site will be controlled through the selection of quiet plant and inclusion of physical mitigation measures (engine enclosures, attenuated louvres, stack silencers). Due to technical and spatial constraints (cooling demand required and area of site respectively), it is not feasible to include additional techniques. In this regard, all appropriate preventative measures have been applied to minimise noise pollution and hence 'best available techniques' (BAT) have been demonstrated in accordance with the requirements of the Environmental Permitting Regulations.

1.4 Maximum Rating Levels at noise sensitive receptor locations, i.e. when the facility is producing maximum power generation, would be up to 1, 5 and 7 dB above the representative background sound levels during the daytime, evening and night-time periods, respectively.

1.5 However, due to reasonably low Rating Levels and resultant ambient sound levels not noticeably changing or being of a magnitude likely to increase the risk for annoyance in external amenity areas or sleep disturbance, it is considered that significant adverse impacts would not occur.

1.6 Furthermore, the risk for adverse impact during night-time periods is significantly reduced as, based on operational experience of other similar facilities, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over a year, would the facility operate, i.e. 3% of the night-time period on average. Also, Rating Levels would often be lower than considered, reflecting the reduced power demand.

1.7 Consequently, when considering the operation of the facility over the entire year period, the resulting site noise impact would be minor adverse to adverse at all NSRs for all time periods. However, on the basis that significant adverse impacts would be avoided, and adverse impacts minimised, the proposed development would comply with the 'Noise Policy Statement for England', which sets out the long term overarching vision of Government noise policy.

1.8 TFGP and T2FGP will be very unlikely to operate concurrently, only as a result of a capacity market event (a rare event). As such, a cumulative noise assessment considering both TFGP and T2FGP has not been undertaken as this would be very unlikely to ever occur and then only for a short period of time.

2 Introduction

2.1 The Acoustics, Noise and Vibration Team at Savills has been appointed by Thurrock Power 2 Limited and Statera Energy Limited to undertake a noise impact assessment to support an 'Environmental Permit' (EP) application for a power generation facility (gas engines with associated plant). The facility will be constructed on land adjacent to the existing 'Thurrock Flexible Generation Plant' (TFGP) development (Site 1) and is known as Site 2 (T2FGP).

2.2 Whilst the T2FGP is immediately adjacent to the permitted TFGP, it has been designed as a separate project and the two facilities will be operated by separate legal entities. It is proposed that the two facilities are separately permitted but the two facilities together will comprise a multi-operator installation.

2.3 Whilst separately operated the T2FGP will not operate concurrently with the TFGF, other than as a result of a capacity market event (a rare event). This restriction is capable of being managed through routine liaison between the two operators. However, in the unlikely event that direct communication between the operators of T2FGP and TFGP is not possible, T2FGP will still be able to regulate its operations effectively using the publicly available information on TFGP's proposed running periods provided through the balancing mechanism.

2.4 On the basis of the above TFGP and T2FGP will be very unlikely to operate concurrently. As such, a cumulative noise assessment considering both TFGP and T2FGP has not been undertaken as this would be very unlikely to ever occur and then only for a short period of time.

2.5 From a noise emissions perspective, the primary source of noise associated with the operation of the facility would be the operation of the gas engines themselves. Whilst these will be enclosed in concrete structures providing significant attenuation, there will be necessary ventilation air intake modules and air outlet attenuators, where internal noise would 'break out'. The other primary noise source will be the external radiator cooling units. Other more minor sources of noise include the exhaust stacks and ductwork, and associated transformers.

2.6 Whilst the facility will potentially operate on a 24/7 basis, it is envisaged to primarily only operate during peak periods of electricity demand or to prevent system instability. This would most typically be for a period ranging from one to seven hours per day, between 08:00 and 20:00 hours. However, there is the potential that the facility could be required to operate during a major power shortage or system stress events (e.g. a Notification of Inadequate System Margin) at any time of the day or night. It should be noted that the likelihood of the facility being required to start up at night is extremely low as peak electricity demand does not occur overnight.

2.7 Based on operational experience of other similar facilities, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over a year, would the facility operate, i.e. 3% of the night-time period on average.

2.8 The assessment has been undertaken based upon information on the proposed development provided by the project team and their experience of operating similar sites. The assessment considers potential adverse noise impacts affecting the nearest 'noise sensitive receptors' (NSRs) to the proposed development site. The assessment has been undertaken following a baseline noise survey and desktop assessment.

2.9 As the facility is adjacent to Site 1, a baseline noise assessment/survey has already been completed.

2.10 The technical content of this assessment has been provided by Savills personnel, all of whom are corporate members, i.e. Member (MIOA) or Fellow (FIOA), of the Institute of Acoustics (IOA), the UK's professional body for those working in acoustics, noise and vibration. The assessment has been undertaken with integrity, objectivity and honesty in accordance with the Code of Conduct of the IOA.

2.11 The Team is also a member of the Association of Noise Consultants (ANC) which seeks to raise the standards of acoustic consultancy and improve recognition of the vital role which good acoustics, and the management and mitigation of noise and vibration play in achieving good design and effective planning in the built and natural environment. Membership of the ANC indicates that the Team is sufficiently competent to pass the high standards for entry to the association.

2.12 This report and assessment has been peer reviewed within the Savills team to ensure that it is technically robust and meets the requirements of our Integrated Management System.

2.13 Personnel and individual qualifications are provided within the Quality Management table at the start of this report and in Appendix A in accordance with the requirement of Section 12 of British Standard (BS) 4142:2014+A1:2019 'Methods for rating and assessing industrial and commercial sound' [1].

3 Site, Area and Baseline Acoustic Environment

Site Layout & Noise Sources

3.1 Figure 3.1 below shows the current proposed site layout, within the red line area.

3.2 The gas engine enclosures (gensets) are grouped, typically with two engine exhausts feeding into one main stack (exit point will be at 20 m above ground level). Radiators are located on the roof of the enclosures, in addition to ventilation outlets. Ventilation inlets are located on the ends of the enclosures.

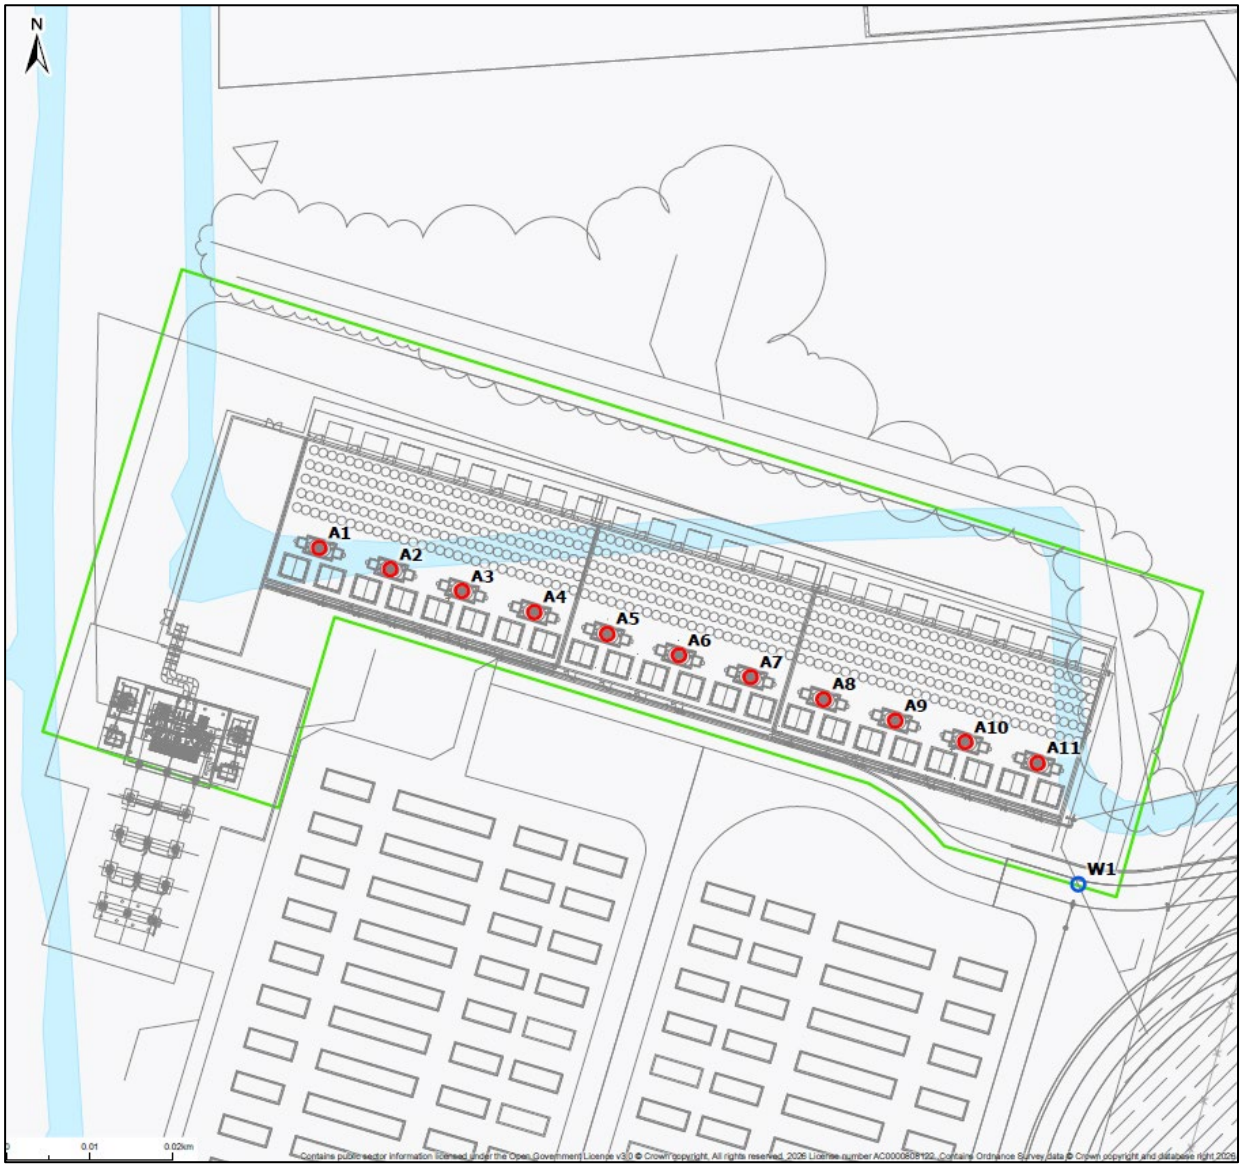

Figure 3.1: Site Layout & Noise Sources

Site and Wider Area

3.3 Figure 3.2 below shows the overall facility boundary and genset installation area, wider area and identified NSRs. Also identified are the locations of baseline sound level monitoring sites (LT1 to LT7), undertaken in February 2018. Further surveys at locations LT1, LT2 and LT3 were undertaken in June and July 2024, as detailed below.

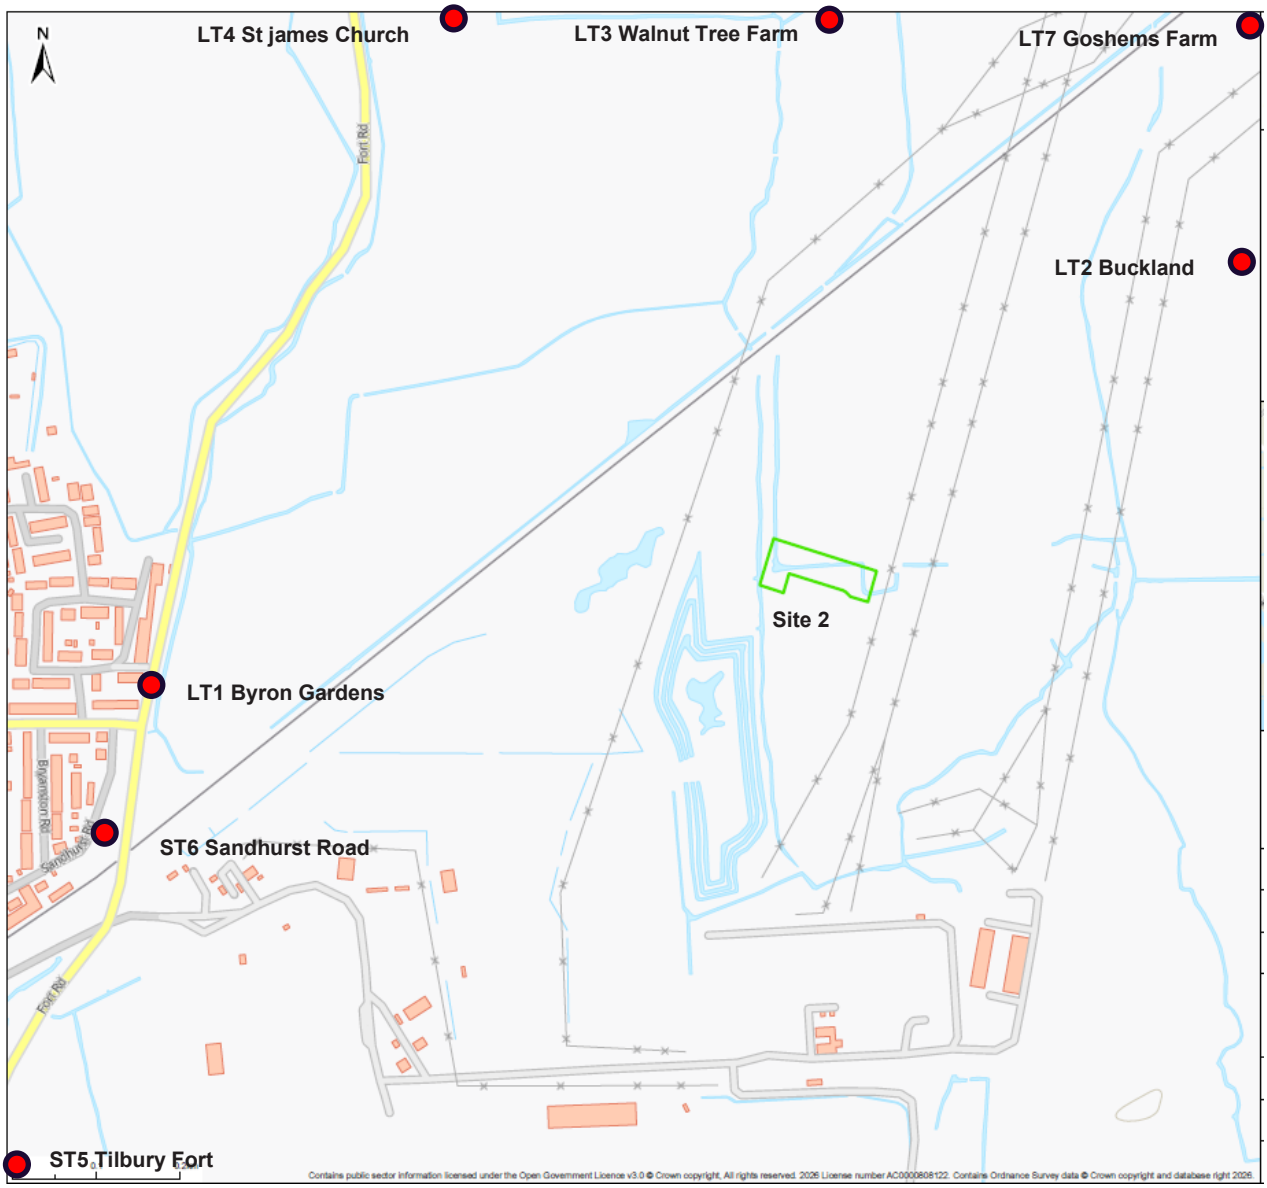

Figure 3.2: Site, Wider Area and Baseline Sound Level Monitoring Locations

3.4 The ground type between the site and the nearest NSRs is soft, open ground (grass fields, foliage etc.), with some hard ground (roads, railways, Site 1 etc.) with an increasing number of intervening structures further from the site.

Baseline Conditions

2018 Baseline Surveys

3.5 In order to establish baseline acoustic conditions at NSR locations to inform the original 2018 Development Consent Order' (DCO) application for Site 1, five long term (19-day) unattended sound level surveys were undertaken in February 2018, together with two short-term surveys.

3.6 Full details of the baseline surveys undertaken are include in Appendix B. Information includes survey locations (including photos), observations, equipment details (serial numbers etc.), meteorological conditions, graphical time histories and statistical analysis.

2024 Baseline Surveys

3.7 In order to establish updated baseline acoustic conditions for Site 1 at the nearest NSR locations to the site, and to determine if the acoustic environment has changed in the intervening period, baseline sound level data (LT2 and LT3) have been obtained from National Highways regarding the 'Lower Thames Crossing' (LTC) project, for which unattended sound level surveys have been ongoing since 2023. Data have been provided by the LTC Team for the 207 day period between 01 October 2023 and 25 April 2024.

3.8 LT2 is deployed at Norrskern at 4 m above ground in a free field position, approximately 500 m east of the site boundary and in the same location as the original 2018 LT2 survey. This location is also consider to be representative of Buckland, located approximately 70 m to the east[1].

3.9 LT3 is deployed at Havers Lodge at 4 m above ground in a free field position at a position approximately 240 m to the north of the site boundary and 150 m west of the original 2018 LT3 survey location at Walnut Tree Farm[2].

3.10 In both cases, the microphone was mounted at 4 m above ground level in a free-field position (at least 3.5 m from any reflecting surface, excluding the ground) using a Class 1 Svantek 307 sound level meters (SLM) in accordance with BS 7445-2:1991 'Description and measurement of environmental noise Part 2: Guide to the acquisition of data pertinent to land use' [2]. The SLM was set to log the A-weighted broadband sound pressure level (SPL) in 125 ms. Raw data have been post processed into 5-minute periods.

[1] Savills has visited the LT2 survey location in 2024 and the following noise sources were noted as affecting the acoustic environment: distant road traffic movements, use of machinery on land to the south, distant industry (metal recycling facility), rustling trees and occasional aircraft.

[2] Savills has visited the LT3 survey location in 2024 and the following noise sources were noted as affecting the acoustic environment: distant road traffic movements, use of machinery on land to the south, distant industry (metal recycling facility), rustling trees and occasional aircraft.

3.11 In addition to the above, Savills has undertaken additional long term unattended monitoring at a third location (LT1) between Thursday 27 June 2024 and Thursday 04 July 2024.

3.12 LT1 was deployed at Sandhurst Road, approximately 870 m to the south-west of the site boundary and 90 m south of the original 2018 LT1 survey location on Byron Gardens.

3.13 The microphone was mounted at 1.8 m above ground level in a free-field position (at least 3.5 m from any reflecting surface, excluding the ground) using a Class 1 NSRT Mk3 sound level meter (SLM) in accordance with BS 7445-2:1991 'Description and measurement of environmental noise Part 2: Guide to the acquisition of data pertinent to land use'. The SLM was set to log the A-weighted broadband sound pressure level (SPL) in 125 ms. Raw data were post processed into 15 minute periods.

3.14 At the time of setting up and collecting the LT1 survey, the following noise sources were noted as affecting the acoustic environment: regular road traffic movements on Fort Road and Brennan Road, occasional aircraft overhead and local pedestrians.

3.15 The equipment calibration level for each measurement was checked with a Rion NC-75 handheld calibrator to 94.0 dB prior to and after the monitoring period; no significant deviation (i.e. above 0.5 dB) was noted.

3.16 Meteorological conditions were monitored with a Luft WS600-UMB Smart Weather Sensor, deployed at the location of LT2. The LT1 survey period (Thursday 27 June 2024 and Thursday 04 July 2024) was largely dry with only one period of rain and wind speeds were low at all times (below 5 m/s). As such, sound level data logged during the period of rain have been removed from the subsequent analysis. However, it should be noted that comparison of the complete dataset with dataset with the periods of rain removed, shows only a negligible difference of less than 1 dB and only for some metrics.

3.17 With regard to the LT2 and LT3 survey data, as this has been obtained over a 207 day period, no data have been removed in the subsequent analysis.

3.18 It has been deemed suitable that this survey data be used to influence the content of this report, due to the relatively short time that has passed since its completion, as well as the fact that the noise environment at the measurement locations have not changed.

3.19 Raw data, time histories, equipment details (serial numbers, calibration certificates etc.) and photos of survey locations are provided in Appendix C.

4 Methodology

Assessment Methodology

4.1 In accordance with Environment Agency (EA) guidance, this assessment has been undertaken based on the methodology detailed in BS 4142, a summary of which is provided below.

4.2 BS 4142 primarily provides a numerical method by which to determine the significance of sound of a commercial and/or industrial nature, i.e. the 'specific sound', at NSR locations.

4.3 The specific sound level may then be corrected for the character of the sound, if appropriate, and is then termed the 'Rating Level' whether corrections are made or not.

4.4 The commentary to paragraph 9.2 of BS 4142 suggests the following subjective methods for the determination of the rating penalty for tonal, impulsive and/or intermittent specific sounds:

"Tonality

For sound ranging from not tonal to prominently tonal the Joint Nordic Method gives a correction of between 0 dB and +6 dB for tonality. Subjectively, this can be converted to a rating penalty of 2 dB for a tone which is just perceptible at the noise receptor, 4 dB where it is clearly perceptible, and 6 dB where it is highly perceptible.

Impulsivity

A correction of up to +9 dB can be applied for sound that is highly impulsive, considering both the rapidity of the change in sound level and the overall change in sound level. Subjectively, this can be converted to a penalty of 3 dB for impulsivity which is just perceptible at the noise receptor, 6 dB where it is clearly perceptible, and 9 dB where it is highly perceptible.

Intermittency

When the specific sound has identifiable on/off conditions, the specific sound level should be representative of the time period of length equal to the reference time interval which contains the greatest total amount of on time. … If the intermittency is readily distinctive against the residual acoustic environment, a penalty of 3 dB can be applied.

Other sound characteristics

Where the specific sound features characteristics that are neither tonal nor impulsive, nor intermittent, though otherwise are readily distinctive against the residual acoustic environment, a penalty of 3 dB can be applied."

4.5 The Rating Level is then compared to the background sound level, which should be representative of the period being assessed.

4.6 The approach that has been adopted for this project is based on unattended surveys to obtain 15-minute values of $L_{A90,T}$ for a continuous period of at least 1-week at each assessment location. Representative background sound levels for the daytime and night-time periods have been derived from a combination of statistical data analysis; review of the temporal variations of sound and meteorological data throughout the survey period; and professional judgment supplemented by aural and visual observations of the acoustic environment at the survey locations.

4.7 Only data that were measured when the wind speeds were at or less than 5 m/s were included in the dataset used to derive the baseline noise levels. The standard indicates that measurements can be taken in wind speeds up to 5 m/s, i.e. it states *"Exercise caution when making measurements in poor weather conditions such as wind speeds greater than 5 m/s"*. It is considered that, by only using data obtained when wind speeds are at or less than 5 m/s, data will be obtained that is valid in this respect in accordance with BS 4142.

4.8 An initial estimate of the impact of the specific sound is obtained by subtracting the representative background sound level from the Rating Level.

4.9 Typically, the greater this difference, the greater is the magnitude of the impact:

- A difference of around +10 dB or more is likely to be an indication of a significant adverse impact, depending on the context.
- A difference of around +5 dB is likely to be an indication of an adverse impact, depending on the context.

4.10 The lower the rating level is relative to the representative background sound level, the less likely it is that the specific sound source will have an adverse impact or a significant adverse impact. Where the rating level does not exceed the background sound level, this is an indication of the specific sound source having a low impact, depending on the context.

4.11 The significance of the effect of the noise in question should be determined on the basis of the initial estimate of impact significance from the BS 4142 assessment with reference to the examples of outcomes described within the PPG-N and after having considered the context of the sound. It is necessary to consider all pertinent factors, including:

- the absolute level of sound;
- the character and level of the residual sound compared to the character and level of the specific sound; and
- the sensitivity of the receptor and whether dwellings or other premises used for residential purposes will already incorporate design measures that secure good internal and/or outdoor acoustic conditions.

Noise Propagation Methodology

4.12 As the facility is not yet operational, specific sound levels associated with operation of the facility at NSR locations have been predicted using a 3D sound model, built using SoundPLAN 9.1 noise modelling software.

4.13 The model predicts sound levels under light down-wind conditions based on hemispherical sound propagation with corrections for atmospheric absorption, ground effects, screening and directivity based on the procedure detailed in ISO 9613-2:2024 ‘Acoustics — Attenuation of sound during propagation outdoors Part 2: Engineering method for the prediction of sound pressure levels outdoors’ [3].

5 Noise Monitoring Data and Predictions

Representative Baseline Sound Levels

5.1 Tables 5.1 to 5.3 and Figures 5.1 to 5.3 below provide a tabular and graphical summary of the 5- and 15-minute baseline sound levels measured at LT1, LT2 and LT3 respectively, for the daytime (07:00 to 23:00 hours), evening (19:00 to 23:00 hours) and night-time (23:00 to 07:00 hours) periods. Note that the figures only show background sound levels.

5.2 BS 4142 requires that the background sound levels adopted for the assessment are representative of the period being assessed. However, the Standard states that there is no 'single' background sound level that can be derived from such measurements. It is particularly difficult to determine what is 'representative' of the night-time period because it can be subject to a wide variation in background sound levels between the beginning and end of the night period, and the quieter middle part of the night period. The accompanying note states that *"a representative level should account for the range of background sounds levels and should not automatically be assumed to be either the minimum or modal value"*.

5.3 In this instance, for the daytime and evening periods, the 25th percentile levels of the long term survey data have been used to characterise the baseline sound environment at all NSRs.

5.4 This is not the lowest sound level encountered but is lower than that obtained using the average. It therefore represents somewhere in the range of lower sound levels that are likely to be encountered and provides a precautionary assessment. For 75% of the time, baseline sound levels will be higher than the 25th percentile levels. Use of the 25th percentile ensures that any periods when higher wind speeds (or other extraneous noise) could have affected the measured baseline sound levels do not unduly affect the analysis.

5.5 With regard to the 2023/2024 LT2 and LT3 survey data, as this has been obtained over a 207 day period, no data logged during periods of precipitation or high wind has been removed from the statistical analysis. However, as the analysis considers the lower quartile of data. obtained over a substantially long period, it is considered that this provides a very representative view of the prevailing acoustic environment at the two survey locations, allowing for a robust assessment to be undertaken.

5.6 For the night-time period, the 50th percentile levels, i.e. most commonly occurring, of the long term survey data have been used to characterise the baseline sound environment at all NSRs.

5.7 This on the basis that night-time operation of the power generation facility would be generally very limited (around 3% of the night-time period) and would be very much more likely to occur during the morning shoulder period, in the hour or so before 07:00 hours, when potential demand would be highest. During these periods, the background sound level is higher than during the quietest

period of the night, typically 02:00 to 04:00 hours. As such, if using the 25th percentile value, background sound levels would be skewed to this period, when the facility is unlikely to be in operation. It should still be noted that, for 50% of the time, background sound levels would be higher.

5.8 This is indicated below on the time history chart for LT1, which shows that, during the morning shoulder period, the background sound level is approximate 3 to 7 dB higher than the lowest level occurring at around 03:00 hours (further data in Appendix B).

5.9 Representative baseline residual levels have been based on the 50th percentile level, i.e. the median value.

Comparison with Historic 2018 Baseline Data

5.11 Tables 5.7 and 5.8 below provide a summary of the representative background and residual sound levels at survey location LT1, LT2 and LT3 as measured in 2024 and 2018. Further details of the 2018 data are provided in Appendix B.

Table 5.7: 2024 and 2018 Representative Background Sound Levels

Period	LT1: Byron Gardens (dB $L_{A90,T}$)			LT2: Buckland (dB $L_{A90,T}$)			LT 3: Havers Lodge (dB $L_{A90,T}$)		
	2018	2024	Delta	2018	2024	Delta	2018	2024	Delta
Day	40	39	*-1*	38	40	*+2*	42	42	*0*
Eve	36	35	*-1*	34	36	*+2*	36	38	*+2*
Night	39	34	*-5*	35	37	*+2*	37	40	*+3*

Table 5.8: 2024 and 2018 Representative Residual Sound Levels

Period	LT1: Byron Gardens (dB $L_{Aeq,T}$)			LT2: Buckland (dB $L_{Aeq,T}$)			LT 3: Havers Lodge (dB $L_{Aeq,T}$)		
	2018	2024	Delta	2018	2024	Delta	2018	2024	Delta
Day	62	59	*-3*	48	49	*+1*	57	51	*-6*
Eve	56	53	*-3*	42	41	*-1*	49	46	*-3*
Night	50	49	*-1*	39	40	*+1*	44	44	*0*

5.12 With reference to Tables 5.7 and 5.8 above, representative baseline sound levels are broadly comparable as measured in 2028 and 2023/2024 at all three surveys locations and for all three time periods. It should be noted that survey location LT3 was located in closer proximity to the road in 2018 compared to 2024 and this is the reason for the significantly lower residual sound level, particularly during the daytime period.

5.13 Nevertheless, in 2018 an addition to the above locations was surveyed, St James' Church (LT4), which, given the proximity to survey location LT3 (490 m to the east) and similar acoustic environment at both locations (as previously determined in 2018), a similar change to the 2018 baseline sound levels have been applied to the measured levels in 2024.

5.14 On the basis of the above, Table 5.9 below provides the representative baseline sound levels that have been used in the subsequent assessment.

Table 5.9: Representative Baseline Sound Levels

Location	Period	Background Sound Level $L_{A90,T}$ (dB)	Residual Sound Level $L_{Aeq,T}$ (dB)
LT1	Daytime[1]	39	59
	Evening[2]	35	53
	Night-time[3]	34	49
LT2	Daytime	40	49
	Evening	36	41
	Night-time	37	40
LT3	Daytime	42	51
	Evening	38	46
	Night-time	40	44
LT4	Daytime	41	48
	Evening	35	44
	Night-time	41	41

Notes:
1.Daytime 07:00 to 19:00 hours.
2.Evening 19:00 to 23:00 hours.
3.Night-time 23:00 to 07:00 hours

Comment

5.15 It is acknowledged that night-time background sound levels are the same or higher than the evening at some locations. This is considered to be reasonable on the basis that the facility is more likely to operate at the shoulder periods of night when demand is highest, associated with increased general activity resulting in higher background sound levels.

5.16 It should also be noted that all locations and for all periods, background sound levels are low and are about 30 dB $L_{A90,T}$ for LT2, LT3 and LT4 which, for the 1997 version of BS 4142, was considered to be very low.

5.17 The adopted representative survey locations for the nearest affected NSRs to the facility are presented in Table 5.10, below. These NSRs have been identified as the likely most affected receptors during the operation of the facility.

Table 5.10: Adopted Representative Survey Locations for NSRs

NSR	Representative Survey Location
Byron Gardens	LT1
Gun Hill Farm	LT4
Galsworthy Road	LT1
Havers Lodge	LT3
Buckland	LT2
St James' Church	LT4
Clarendon Road	LT3

Specific Sound Level Predictions

5.18 The externally located noise generating aspects of the facility include 22 genset enclosures, albeit these are generally located directly adjacent to each other and are not individually positioned.

5.19 Each enclosure has an associated ventilation air intake module at low level and air outlet attenuator at roof level. Also at roof level are the cooling radiators.

5.20 Each enclosure/genset has associated exhaust ductwork which feeds into an attenuated stack with a discharge point (at 20 m AGL). Generally, two gensets are grouped into one stack.

5.21 Model input data and manufacturer's data sheets (where available) are provided as Appendix D and are summarised below.

Gensets

5.22 Each genset has a 'sound power level' (SWL) of 128 dBA L_W. Based on the dimensions of the genset enclosures, the internal reverberant sound pressure level would be 112 dBA L_{Pi}[3]. Each genset is housed in a concrete enclosure (48 dB R_w).

5.23 On this basis, the resultant façade radiating SWL is 65 dBA L_W per unit area, with each enclosure then having an effective total SWL of 89 dBA L_W. Octave band data have been provided by the manufacturer. The genset enclosures have been modelled as industrial buildings with four radiating facades and a roof.

Radiators

5.24 Each genset has two associated radiators located above the roof level of the enclosure. Each radiator has a SWL of 90 dBA L_W and these have been modelled as area sources above the genset enclosures.

Ventilation Air Intake Modules

5.25 Each genset enclosure has a ventilation air intake module at low level. Based on a similar gas engine scheme and the acoustic design requirements for this project, the SWL of these modules is 86 dBA L_W. These have been modelled as vertical area sources (4 x 4 m).

Air Outlet Attenuators

5.26 Each genset enclosure has a ventilation air intake module at roof level. Based on a similar gas engine scheme and the acoustic design requirements for this project, the SWL of these outlet attenuators is 89 dBA L_W. These have been modelled as four vertical area sources, each with a SWL of 83 dBA L_W.

Exhaust Stacks

5.27 Each individual genset has an exhaust, with two exhausts feeding into a single silenced stack, which terminates at 20 m AGL. Each silenced exhaust outlet (two engine exhausts) has a SWL of 84 dBA L_W (73 dBA L_p at 1 m). A standard stack directivity has been applied.

Exhaust Ductwork

5.28 Exhaust ductwork at the exit point from the enclosures to the exhaust stakes has been modelled as line sources with a unit length SWL of 70 dBA L_W per unit length. This is based on data measured at similar other facilities and accounts for lagging materials that are fixed to the ductwork.

[3] 17.6 x 4.8 x 4 m. $L_p = L_W - 10\log(V) + 10\log(T) + 14$, assumed 0.4 s T

Transformers

5.29 A single transformer has been modelled as a point source at 1 m AGL, with a SWL of 82 dBA L_W.

5.30 The following assumptions have been incorporated into the noise model:

- the order of reflection has been set as 2;
- the topography of the site and the surrounding area has been obtained from publicly available data sources;
- the effect of screening from solid structures (buildings) has been incorporated into the modelling process by importing OS Open Data 'Settlement Area' shape file data into the model and publicly available data; and
- the ground type in the model has been set as hard (G=0) for the site and soft (G=1) for the immediate surrounding area of fields and mixed for the wider area (G=0.5).

5.31 On the basis of the above, Table 5.11 below provides a summary of modelled maximum specific sound levels at the nearest NSRs. Specific sound levels are at 1.5 m from facades in free field equivalent locations and at 1.5 and 4 m AGL.

5.32 Figure 1 at the end of the report provides a graphical presentation of noise levels at 4 m AGL.

5.33 It should be noted that the specific sound levels presented below are on the basis that the facility would be providing maximum power, with all plant in operation at 100% design capacity, i.e. a 'worst case' scenario in terms of noise. Typically, demand would be lower and noise emissions would be correspondingly reduced as a result. For example, if half the demand is required, specific sound levels would be 3 dB lower.

Table 5.11 Predicted Maximum Specific Sound Levels

NSR	Specific Sound Level $L_{Aeq,Tr}$ (dB)	
	1.5 m AGL	4 m AGL
Byron Gardens	40	41
Gun Hill Farm	38	38
Galsworthy Road	40	40
Havers Lodge	39	39
Buckland	33	34
St James' Church	39	39

Rating Levels

5.34 With reference to BS 4142, a character correction can be applied to the specific sound level depending on the acoustic characteristics of the sound at the assessment location, including corrections for impulsivity, tonality, intermittency or other distinctive character.

5.35 In this case, it has not been considered appropriate to apply any correction for any assessment/NSR location. This is on the basis that:

1. The specific sound would not be impulsive or intermittent, rather it would be on at least for a full assessment period (1-hour during the daytime, 15-minutes during the night-time), potentially gradually ramping up/down at any one time.
2. Based on professional experience, whilst the radiators incorporate a fan, with potential for tonal emissions, the surrounding parts of the coolers (grilles etc.) act to provide a masking sound such that the resulting emissions are more broadband/aerodynamic and *'whooshing'* in nature.
3. As it is considered that the only source of tonal noise from the proposed development is from the transformers and the contribution from this source to the overall specific sound is negligible, it is unlikely that noise levels at the nearby NSRs would be perceived or characterised as tonal.
4. The specific sound is broadband in nature and steady with little variation or unusual sound/features that might be considered incongruous or readily distinctive compared to the residual acoustic environment.

5.36 On the basis of the above, specific sound levels are equal to the Rating Levels at all NSRs.

Operating conditions

5.37 The development would operate during peak periods of electricity demand or to prevent system instability. Based on information provided at the planning and DCO stage, this would most typically be for a period ranging from one to seven hours, between 08:00 and 20:00 hours.

5.38 However, there is the potential that the proposed development could be required to operate during a major power shortage or system stress events (e.g. a Notification of Inadequate System Margin) at any time of the day or night. It should be noted that the likelihood of the facility being required to start up in the middle of the night is extremely low as peak electricity demand does not occur overnight.

5.39 On this basis, Figure 5.5 below shows an indicative typical pattern of average daily operating hours in each month of the year. A further breakdown of indicative typical operating hours at each time of the day during the winter, summer and annual periods is presented in Table 1.1. These breakdowns are based on data from similar operational peaking plant provided by the applicant; they are indicative of likely seasonal and diurnal cycles to inform the assessment of impacts, but are not the fixed operating hours of the proposed facility.

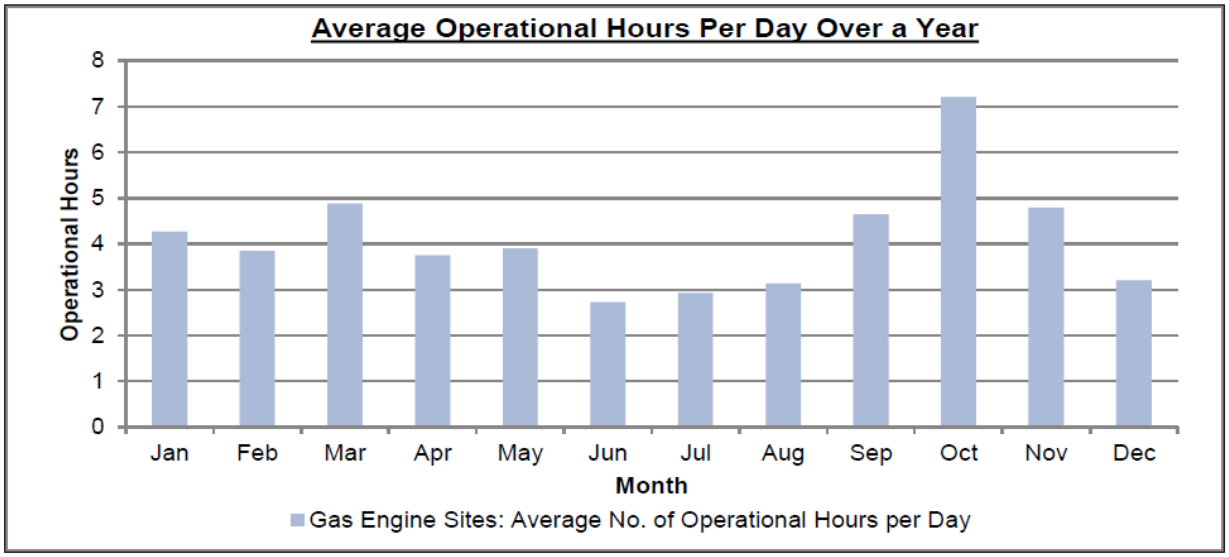

Figure 5.5: Site, Wider Area and Baseline Sound Level Monitoring Locations

5.40 As can be seen from Table 5.12, operational hours during night-time periods (23:00 to 07:00 hours) account for less than 0.2% of the total operating hours over the course of a year, at a similar peaking power facility site operated by the applicant. Significant night-time operation is therefore unlikely.

Table 5.12 Typical Daily Operating Times Breakdown of an Operational Peaking Plant

Period (hours)	Percentage total operational time (%)
04:00 to 07:00	2
07:00 to 16:00	41
16:00 to 19:00	44
19:00 to 23:00	12
23:00 to 07:00	0.2

6 Noise Impact Assessment

6.1 Tables 6.1, 6.2 and 6.3 below provide an initial estimate of the noise impact at the nearest NSRs for the daytime, evening and night-time periods, respectively. Note daytime and evening Rating Levels are at ground floor level (1.5 m AGL) and night-time at first floor level (4 m AGL).

Table 6.1 Daytime (07:00 to 19:00 hours) BS 4142 Numerical Assessment

St James' Church	39	0	39	41	+2

6.2 With regard to the rating/background level differences, BS 4142:2014+A1:2019 states:

- A difference of around +10 dB or more is likely to be an indication of a significant adverse impact, depending on the context;
- A difference of around +5 dB is likely to be an indication of an adverse impact, depending on the context; and
- The lower the rating level is relative to the measured background sound level, the less likely it is that the specific sound source will have an adverse impact or a significant adverse impact. Where the rating level does not exceed the background sound level, this is an indication of the specific sound source having a low impact, depending on the context.

6.3 On the basis of the above, and with reference to Table 6.1, it is considered that, during the daytime period there is a low risk that operation of the facility would result in adverse impact at NSRs, significant or otherwise, as Rating Levels are, at most, up to 1 dB above background.

6.4 With reference to Tables 6.2 and 6.3 during the evening and night-time periods, as Rating Levels are up to 5 and 7 dB above background, there is a risk that operation of the facility would result in adverse or significant adverse impact at NSRs, depending on the context.

Daytime and Evening

6.5 In this instance, it is considered that the context of the noise does reduce the risk for adverse impact at all NSRs, such that significant adverse impact would be unlikely to occur during all time periods as explained below.

6.6 Maximum Rating Levels of 41 dB $L_{Ar,Tr}$ are considered to be of a low magnitude (note that the 1997 revision of BS 4142 considered Rating Levels below 35 dB to be very low) and a magnitude on its own to unlikely to result in significant adverse impact regardless of the difference to the background sound level.

6.7 In this regard, BS 4142:2014 states:

"Where background sound levels and rating levels are low, absolute levels might be as, or more, relevant than the margin by which the rating level exceeds the background. This is especially true at night."

6.8 Considering absolute sound levels and the likelihood for impact, the addition of the maximum specific sound to the existing residual sound level would result in no more than a 1 and 3 dB

increase in ambient sound level during the daytime and evening periods respectively. This change in ambient sound level is summarised in Tables 6.4 and 6.5 below

Table 6.4 Scenario 1: Daytime (07:00 to 19:00 hours) Ambient Noise Change Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Residual Sound Level, dB $L_{Aeq,T}$	Ambient Sound Level, dB $L_{Aeq,T}$	Change (dB)
Byron Gardens	40	59	59	0
Gun Hill Farm	38	48	48	0
Galsworthy Road	40	59	59	0
Havers Lodge	39	51	51	0
Buckland	33	49	49	0
St James' Church	39	48	49	+1

Table 6.5 Scenario 1: Evening (19:00 to 23:00 hours) Ambient Noise Change Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Residual Sound Level, dB $L_{Aeq,T}$	Ambient Sound Level, dB $L_{Aeq,T}$	Change (dB)
Byron Gardens	40	53	53	0
Gun Hill Farm	38	44	45	+1
Galsworthy Road	40	53	53	0
Havers Lodge	39	46	47	+1
Buckland	33	41	42	+1
St James' Church	39	44	45	+1

6.9 For steady sources of a similar character, a +/-3 dB change is generally taken as the minimum change that is perceptible to most people. On this basis, as the specific sound would be steady, a change of +3 dB is not considered to be a significant increase and would likely not be noticeable.

6.10 Furthermore, the addition of the specific sound would not result in ambient sound levels increasing from below 50 or 55 dB $L_{Aeq,T}$ to above. On this basis, there would be no increase in the risk for the specific sound to increase the risk for annoyance in external amenity areas.

6.11 On the basis of the above, whilst the specific sound may be discernible during quite periods, when the facility is maximum power, it would not be of a magnitude to result in overall ambient sound levels noticeably increasing or increase the risk for annoyance.

6.12 It should also be noted that, at the most affected NSRs (St James' Church and Havers Lodge), distant industrial activity was observed as affecting the acoustic environment (as noted in Appendix B). As such, the new noise source would not be as discernible as it may otherwise be compared to the situation where industrial/commercial noise did not already affect the environment.

6.13 Furthermore, the above assessment is based on use of the 25th percentile of all background sound level data. As such, for 75% of the daytime and evening periods, background sound levels would

be higher and the difference between the Rating and background sound levels, lower. For example, at the most affected NSR, St James' Church, during the daytime and evening periods for 50% of the time, the background sound level is 2 dB higher, such the Rating/background sound level difference would be +3 dB for the evening period.

6.14 Finally, it should be noted that the assessment above has been completed on the basis that the facility would be providing maximum power, i.e. a 'worst case' scenario in terms of noise. Typically, demand would be lower and noise emissions would be correspondingly lower as a result.

6.15 On the basis that maximum demand is more likely to occur during the daytime period, rather than the evening (or night-time, as detailed below), it is likely that Rating Levels during the evening would normally be lower. For example, if half the demand is required, Rating Levels would be 3 dB lower and equal the evening 25th percentile background sound level.

Night-time

6.16 Similarly as for the daytime and evening periods, the maximum Rating Levels of 34 to 41 dB $L_{Ar,Tr}$ are considered to be of a low magnitude, and are considered to not be of sufficient magnitude likely to result in adverse impact, such as sleep disturbance, particularly as the sound would be steady with no impulsive or intermittent features.

6.17 With reference to the 'Guidelines for Community Noise' (GCN) [4] document, resultant ambient sound levels would be of a magnitude below that which sleep disturbance may result (45 dB $L_{Aeq,T}$) at all NSRs where the residual sound level is currently below that level, apart from the NSR Havers Lodge. This change in ambient noise level is summarised in Table 6.6 below.

Table 6.6 Scenario 2: Night-time (23:00 to 07:00 hours) Ambient Noise Change Assessment

NSR	Specific Sound Level, dB $L_{Aeq,Tr}$	Residual Sound Level, dB $L_{Aeq,T}$	Ambient Sound Level, dB $L_{Aeq,T}$	Change (dB)
Byron Gardens	41	49	50	+1
Gun Hill Farm	38	41	43	+2
Galsworthy Road	40	49	50	+1
Havers Lodge	39	44	45	+1
Buckland	34	40	41	+1
St James' Church	39	41	43	+2

6.18 Whilst the Rating/background level difference is up to +7 dB during the night-time period, this relates to an external assessment location, whereas during this period residents are more likely to be inside dwellings, where associated sound levels would be lower. On the basis that the facades of dwellings will attenuate external sound by 12 to 20 dB, considered to be a reasonable assumption as partially open windows provide ~15 dB attenuation, appropriate internal sound levels

for sleeping would be achieved (internal ambient sound levels <30 dBA), and sleep disturbance would be unlikely to result.

6.19 In addition to the low maximum Rating Level, a critical aspect reducing the risk for adverse impact during the night-time period is the very limited number of times and likely durations the facility would operate during the night-time period and, if in operation, whether maximum demand would be provided.

6.20 Based on operational experience of other similar facilities, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over the course of a year, would the facility likely be operational i.e. 3% of the night-time period on average. Such operation would likely be during the shoulder period (before 07:00 hours) when background noise levels are higher. The facility would be very unlikely to operate at the quietest part of the night (02:00 to 04:00 hours).

6.21 On this basis, whilst a +7 dB maximum Rating/background level difference, with a Rating Level of 41 dB $L_{Ar,Tr}$, may result in a moderate adverse impact if occurring for the whole, or majority of the night, if only occurring for 88-hours out of 2,920 night-time hours over the course of a year, the risk for long term impact is significantly reduced.

6.22 Furthermore, if only providing half the maximum demand, Rating Levels would be 3 dB lower and only 4 dB above the night-time background sound level.

6.23 Consequently, it is considered that night-time impacts, across a period of time, would be negligible at the majority of NSRs during the night-time period, albeit potentially minor impact may result at the most affected NSRs.

Summary

6.24 Maximum Rating Levels at NSR locations, i.e. when the facility is producing maximum power, would be up to 1, 5 and 7 dB above the representative background sound level during the daytime, evening and night-time periods, respectively.

6.25 However, due to low Rating Levels and resultant ambient sound levels not noticeably changing or being of a magnitude likely to increase the risk for annoyance in external amenity areas or cause sleep disturbance, it is considered that significant adverse impacts would not occur.

6.26 Furthermore, the risk for adverse impact during night-time period for is significantly reduced as for only 88 hours of the night-time period (23:00 to 07:00 hours) over the course of a year, would the facility likely be operational i.e. 3% of the night-time period on average. Also, Rating Levels would often be lower than considered, reflecting the reduced power demand.

6.27 Consequently, when considering the operation of the facility over the entire year period, the resulting site noise impact would be no greater than adverse, i.e. significant impacts/effects avoided at all NSRs for all time periods, as summarised in Table 6.7 below.

6.28 On the basis that significant adverse impacts would be avoided, and adverse impacts minimised (through the application of noise control methods/techniques detailed in Section 7), the proposed development would comply with the 'Noise Policy Statement for England' (NPSE) [5], which sets out the long term overarching vision of Government noise policy.

Table 6.7 Overall Site Noise Impact

NSR	Overall: Site Noise Impact		
	Daytime	Evening	Night-time
Byron Gardens	Negligible	Minor	Adverse
Gun Hill Farm	Negligible	Minor	Negligible
Galsworthy Road	Negligible	Minor	Adverse
Havers Lodge	Negligible	Minor	Negligible
Buckland	Negligible	Negligible	Negligible
St James' Church	Negligible	Minor	Minor

7 Noise Control

7.1 With reference to Section 6 above, operation of the facility over the entire year period would result in negligible to minor adverse noise impacts at all NSRs for all time periods.

7.2 However, this is based on the following application of noise control methods/techniques:

- the gensets housed in concrete enclosures;
- attenuation of the genset air inlets and outlets;
- silencers fitted to the genset exhausts; and
- location of plant away from NSRs.

7.3 Due to technical and spatial constraints, it is not feasible to select radiators with lower noise emissions or install the radiators differently, i.e. at low/ground level or be more enclosed.

7.4 On the basis of the above, all techniques have been employed to minimise noise emissions as far as reasonably practicable.

7.5 In this regard, the facility has applied all appropriate preventative measures taken to minimise noise pollution, in particular with the application of 'best available techniques' (BAT), in accordance with The Environmental Permitting (England and Wales) Regulations 2016.

7.6 A Noise Management Plan is include as Appendix E of the report.

8 Uncertainty

8.1 In all assessments, it is good practice to consider uncertainty which can arise from a number of different aspects. There are degrees of uncertainty associated with: instrumentation used for surveying; measurement technique and the variables influencing the measurement results such as transmission path and weather conditions; source terms used for modelling; calculation uncertainty; assessment uncertainty; and the subjective response of residents to noise sources.

8.2 Uncertainty due to instrumentation has been significantly reduced with the introduction of more modern instrumentation and is reduced further by undertaking field calibration checks on sound level meters before and after each measurement period with no significant drifty (less than 0.5 dB) and that all instrumentation is within accepted laboratory calibration intervals.

8.3 Every effort has been made to reduce the uncertainty of the baseline sound level measurements. The duration of the baseline survey is considered to significantly reduce the uncertainty associated with the baseline sound levels. Data logged during periods of rainfall has been removed from the analysis. Based on professional judgement including substantial experience of acquiring and analysing baseline data for numerous sites in various locations, and a desk-based review of the site and surrounding area, it is considered that the baseline data acquired during the survey is typical of the area.

8.4 Representative baseline sound levels used in the assessment have been based on the 25% of all data logged, i.e. for 75% of the time, baseline sound levels are higher than used in the assessment. This approach will favour a reasonable ‘worst case’ scenario and a robust assessment to be completed. Representative baseline sound levels have been calculated for three accepted time periods daytime (07:00 to 19:00 hours), evening (19:00 to 23:00 hours) and night-time (23:00 to 07:00 hours).

8.5 For two survey and assessment locations, representative baseline sound levels have been derived through a statistical analysis of 207 days of data, a substantially long period.

8.6 Calculation uncertainty and assessment uncertainty have been reduced by peer review of all baseline data, model input data, model results and assessment calculations, and by using the appropriate level of precision at each stage of the assessment calculations.

8.7 With regard to the primary noise source, the 22 gensets and radiators, acoustic and operational data has been provided by the manufacturer so it is considered there is minimal uncertainty with regard to this data. Acoustic data for the flue stack exhausts has been based on that provided by the silencer manufacture.

8.8 There are uncertainties in any prediction methodology. ISO 9613 Part 2 provides a method for predicting acoustic propagation outdoors. The method is applicable in practice to a great variety of sound sources and environments. It is applicable (directly or indirectly) to most situations including

industrial sound sources, construction activities and many other ground-based sound sources. The estimated accuracy for values of the average downwind sound pressure level is stated as +/-3 dB for a mean source/receptor height of up to five metres and source/propagation separation distance of up to 1 km. For a mean source height between 5 and 30 m, the estimated accuracy is given as +/-1 dB for a source/propagation separation distance of 0 to 100 m and +/- 3 dB for a source/propagation separation distance of >100 m. This is a standard approach and is considered to be an acceptable prediction methodology.

8.9 Specific sound levels have been calculated at ground and first floor level for the daytime and night-time periods respectively, at locations of facades albeit in free-field locations.

8.10 Intervening structures between the site and NSR location and the ground type has been based on a review of mapping and site observations.

8.11 A quantitative assessment has been undertaken based on information provided by the project team for the proposed development and professional judgement based on recognised and accepted empirical calculation methodologies. Where assumptions have been made, these have been informed through assessment and visiting similar facilities and have favoured a worst-case scenario, allowing for a reasonable and robust assessment.

8.12 With regards to subjective response, the noise standards adopted for the assessment are based upon the subjective response of the majority of the population or will be based upon the most likely response of the majority of the population. This is considered to be the best that can be achieved in a population of varying subjective response which will vary dependent upon a wide range of factors.

8.13 All areas and potential consequences of uncertainty have been minimised at every stage of the assessment process. On the basis of the above, and in the context of subjective response, the effects of uncertainty on the assessment conclusions are considered minimal.

9 Summary and Conclusions

9.1 The Acoustics, Noise and Vibration Team at Savills has been appointed by Thurrock Power 2 Limited and Statera Energy Limited to undertake a noise impact assessment to support an 'Environmental Permit' (EP) application for a power generation facility (gas engines with associated plant). The facility will be constructed on land adjacent to the existing 'Thurrock Flexible Generation Plant' (TFGP) development (Site 1) and is known as Site 2.

9.2 Noise emissions from the facility will be controlled through the application of noise control methods/techniques, including the gensets housed in concrete enclosures, attenuation of the genset air inlets and outlets and silencers fitted to the genset exhausts.

9.3 Maximum Rating Levels at NSR locations, i.e. when the facility is producing maximum power, would be up to 1, 5 and 7 dB above the representative background sound level during the daytime, evening and night-time periods, respectively.

9.4 Due to low Rating Levels and resultant ambient sound levels not noticeably changing or being of a magnitude likely to increase the risk for annoyance in external amenity areas or sleep disturbance, it is considered that significant adverse impacts would not occur.

9.5 Furthermore, the risk for adverse impact during night-time periods is significantly reduced as, for only around 88 hours of the night-time period (23:00 to 07:00 hours) over the course of a year, would the facility likely be operational i.e.3% of the night time period on average. Also, Rating Levels would often be lower than considered, reflecting the reduced power demand.

9.6 Consequently, when considering the operation of the facility over the entire year period, the resulting site noise impact would be negligible adverse to adverse at all NSRs for all time periods.

9.7 All techniques have been employed within the design of the facility to minimise noise emissions as far as reasonably practicable. In this regard the facility has applied all appropriate preventative measures taken to minimise noise pollution, in particular with the application of 'best available techniques' (BAT), in accordance with The Environmental Permitting (England and Wales) Regulations 2016.

9.8 On the basis that significant adverse impacts would be avoided, and adverse impacts minimised, the proposed development would comply with the 'Noise Policy Statement for England' (NPSE), which sets out the long term overarching vision of Government noise policy.

Appendices

Appendix A: BS 4142 Statements

Phil Evans: Director - Acoustics

BSc (Hons) Geology; MSc Acoustics, Vibration and Noise Control; Fellow of the Geological Society and Fellow of the Institute of Acoustics

A.1 Phil is a Director and leads the Savills Acoustics Team. He is a specialist in environmental acoustics and is active on a number of committees including the Association of Noise Consultants' Vibration Working Group; British Standards Institution (BSi) Committee GME/21/6/4 - BS 6472: Guide to Evaluation of Human Exposure to Vibration in Buildings; BSi Committee B/564/01 on BS 5228: Noise and Vibration Control on Construction and Open Sites which has now also revised and issued BS 8233:2014 Guidance on sound insulation and noise reduction in buildings. He has been a corporate member of the Institute of Acoustics for over 35 years and is now a Fellow.

A.2 Phil has over 35 years' experience in the project management of, and technical input to, environmental noise and vibration impact assessments for major developments. He is an expert in the industrial/commercial, transportation and construction sectors including the measurement, calculation, evaluation and mitigation of environmental noise and vibration. Phil has significant experience in the preparation and presentation of technical evidence and reports for public inquiries and planning applications. He is experienced in consultation and liaison with government departments, local authorities and other statutory bodies. He is an experienced expert witness. He has a Continuous Professional Development Record to support this competency and experience.

A.3 Phil has been involved in many BS 4142 noise assessments for both the previous and current 2014 version of BS 4142. He has given evidence at public inquiries where BS 4142 has been the primary assessment methodology. He is very familiar with the Standard and attended the joint ANC/BSi launch of the 2014 version of the Standard. On the basis of Phil's overall experience in acoustics combined with particular focus on BS 4142, he is deemed competent for BS 4142 assessments.

A.4 For this project, Phil as taken on the role of Project Director and has been responsible for overseeing and delivering the project.

Peter Barling: Associate - Acoustics

BSc (Hons) Physics; PGDip Environmental Assessment and Management; Member of the Institute of Acoustics

A.6 Peter is an Associate Consultant in Acoustics and environmental acoustics specialist with over 10e years' experience. He has a Degree in Physics and also has a Post Graduate Diploma in Environmental Assessment and Management. He has been a member of the Institute of Acoustics since 2013.

A.7 Peter has project managed and undertaken noise assessments for a variety of developments, including: large scale mixed-use developments, incorporating commercial, retail, leisure and residential elements; on-shore substations for off-shore windfarms; energy from waste facilities; manufacturing facilities; distribution centres; retail units; minerals extraction and exploration; solar farms; and petrol service filling stations. He has provided input into Environmental Impact Assessments (EIAs) and undertaken noise assessments to support planning applications and discharge planning conditions. He has a Continuous Professional Development (CPD) Record to support this competency and experience.

A.8 Peter has undertaken BS 4142 noise assessments for both the previous and current 2014 version of BS 4142. He is familiar with the Standard and has attended and participated in internal and external CPD training seminars regarding the revised 2014 version of the Standard. On the basis of Peter's overall experience in acoustics, combined with particular focus on BS 4142, he is deemed competent for BS 4142 assessments.

A.9 Peter was responsible for undertaking the baseline acoustic survey, and preparation of the assessment and report.

Summary

This Appendix provides details of the baseline noise monitoring undertaken as part of the noise assessment, and in accordance with BS 4142:2014+A1:2019.

Qualifications

This document has been prepared by Josh Wilson, an Acoustic Consultant and full Member of the Institute of Acoustics, who has over four years' experience of environmental noise impact assessment.

It has been checked and authorised by Simon Stephenson, a Technical Director within the Acoustics Team and full member of the Institute of Acoustics, who has 20 years' experience of environmental noise impact assessment.

1. Introduction

1.1.1 RPS has been commissioned by Thurrock Power Ltd to undertake baseline noise monitoring to inform the noise impact assessment for a proposed flexible generation plant comprising gas engines and battery storage near Tilbury (the proposed development).

1.1.2 This report provides the results of baseline sound measurements undertaken to characterise the sound environment in the vicinity of the nearest Noise Sensitive Receptors (NSRs) to the proposed development including its potential road access and supply gas pipeline routes. These baseline levels will be used in the assessment of effects for the operational and construction noise and vibration assessments to be reported in the Preliminary Environmental Impact Report (PEIR).

1.1.3 Access to all survey locations was agreed with the landowners. The surveys were undertaken between Thursday 1st and Wednesday 21st February 2018.

1.1.4 This report provides a summary of the survey data for each survey location. As stated above, these levels will be relied upon within the assessment carried out for the PEIR. Survey sheets indicating details and locations of noise monitoring equipment are provided in Annex A.

2. Baseline Survey Methodology

2.1 Consultation with Local Planning Authority

2.1.1 The proposed approach to the baseline surveys was described in the Baseline Noise Monitoring Plan issued on 18 January 2018. The survey methodology was subject to consultation and was agreed to be appropriate by Mark Gentry, Environmental Health Officer for Thurrock Council.

2.2 Survey locations

2.2.1 Survey locations were chosen to characterise baseline conditions in the vicinity of the nearest noise sensitive receptors to the proposed development and based on their proximity to the site. The proposed monitoring were as follows:

- LT1 – Byron Gardens: This location is approximately 750 m west of the proposed development and is representative of the residential properties west of Fort Road. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- LT2 – Buckland: This location is approximately 1 km east-north-east of the proposed development and is representative of the residential properties in this area. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- LT3 – Walnut Tree Farm: This location is approximately 840 m north-north-east of the proposed development and is representative of the residential properties in this area. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- LT4 – St James Church: This location is approximately 1 km north of the proposed development and is representative of the church and town hall as well as the wider settlement of West Tilbury. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.
- ST5 – Tilbury Fort: This location is approximately 1.2 km south-west of the proposed development and is representative of the Fort which is controlled by English Heritage and operated as a tourist attraction. It is proposed to undertake short-term noise monitoring at this location during the daytime.
- ST6 – Sandhurst Road: This location is approximately 850 m west of the proposed development and is representative of the residential properties west of Fort Road but nearer to the railway line and existing industrial areas than those properties at Byron Gardens. It is proposed to undertake short-term noise monitoring at this location.
- LT7 – Goshem's Farm: This location is approximately 1.6 km north east of the proposed development and close to the potential gas connection compound and is representative of the residential properties in the area. It is proposed to undertake long-term noise monitoring at this location supplemented by attended short-term measurements.

2.2.2 Table 2.1 provides a summary of the baseline survey locations and grid co-ordinates of where the survey equipment was positioned. All survey locations are identified in Figure 2.1 overleaf.

Table 2.1: Survey locations.

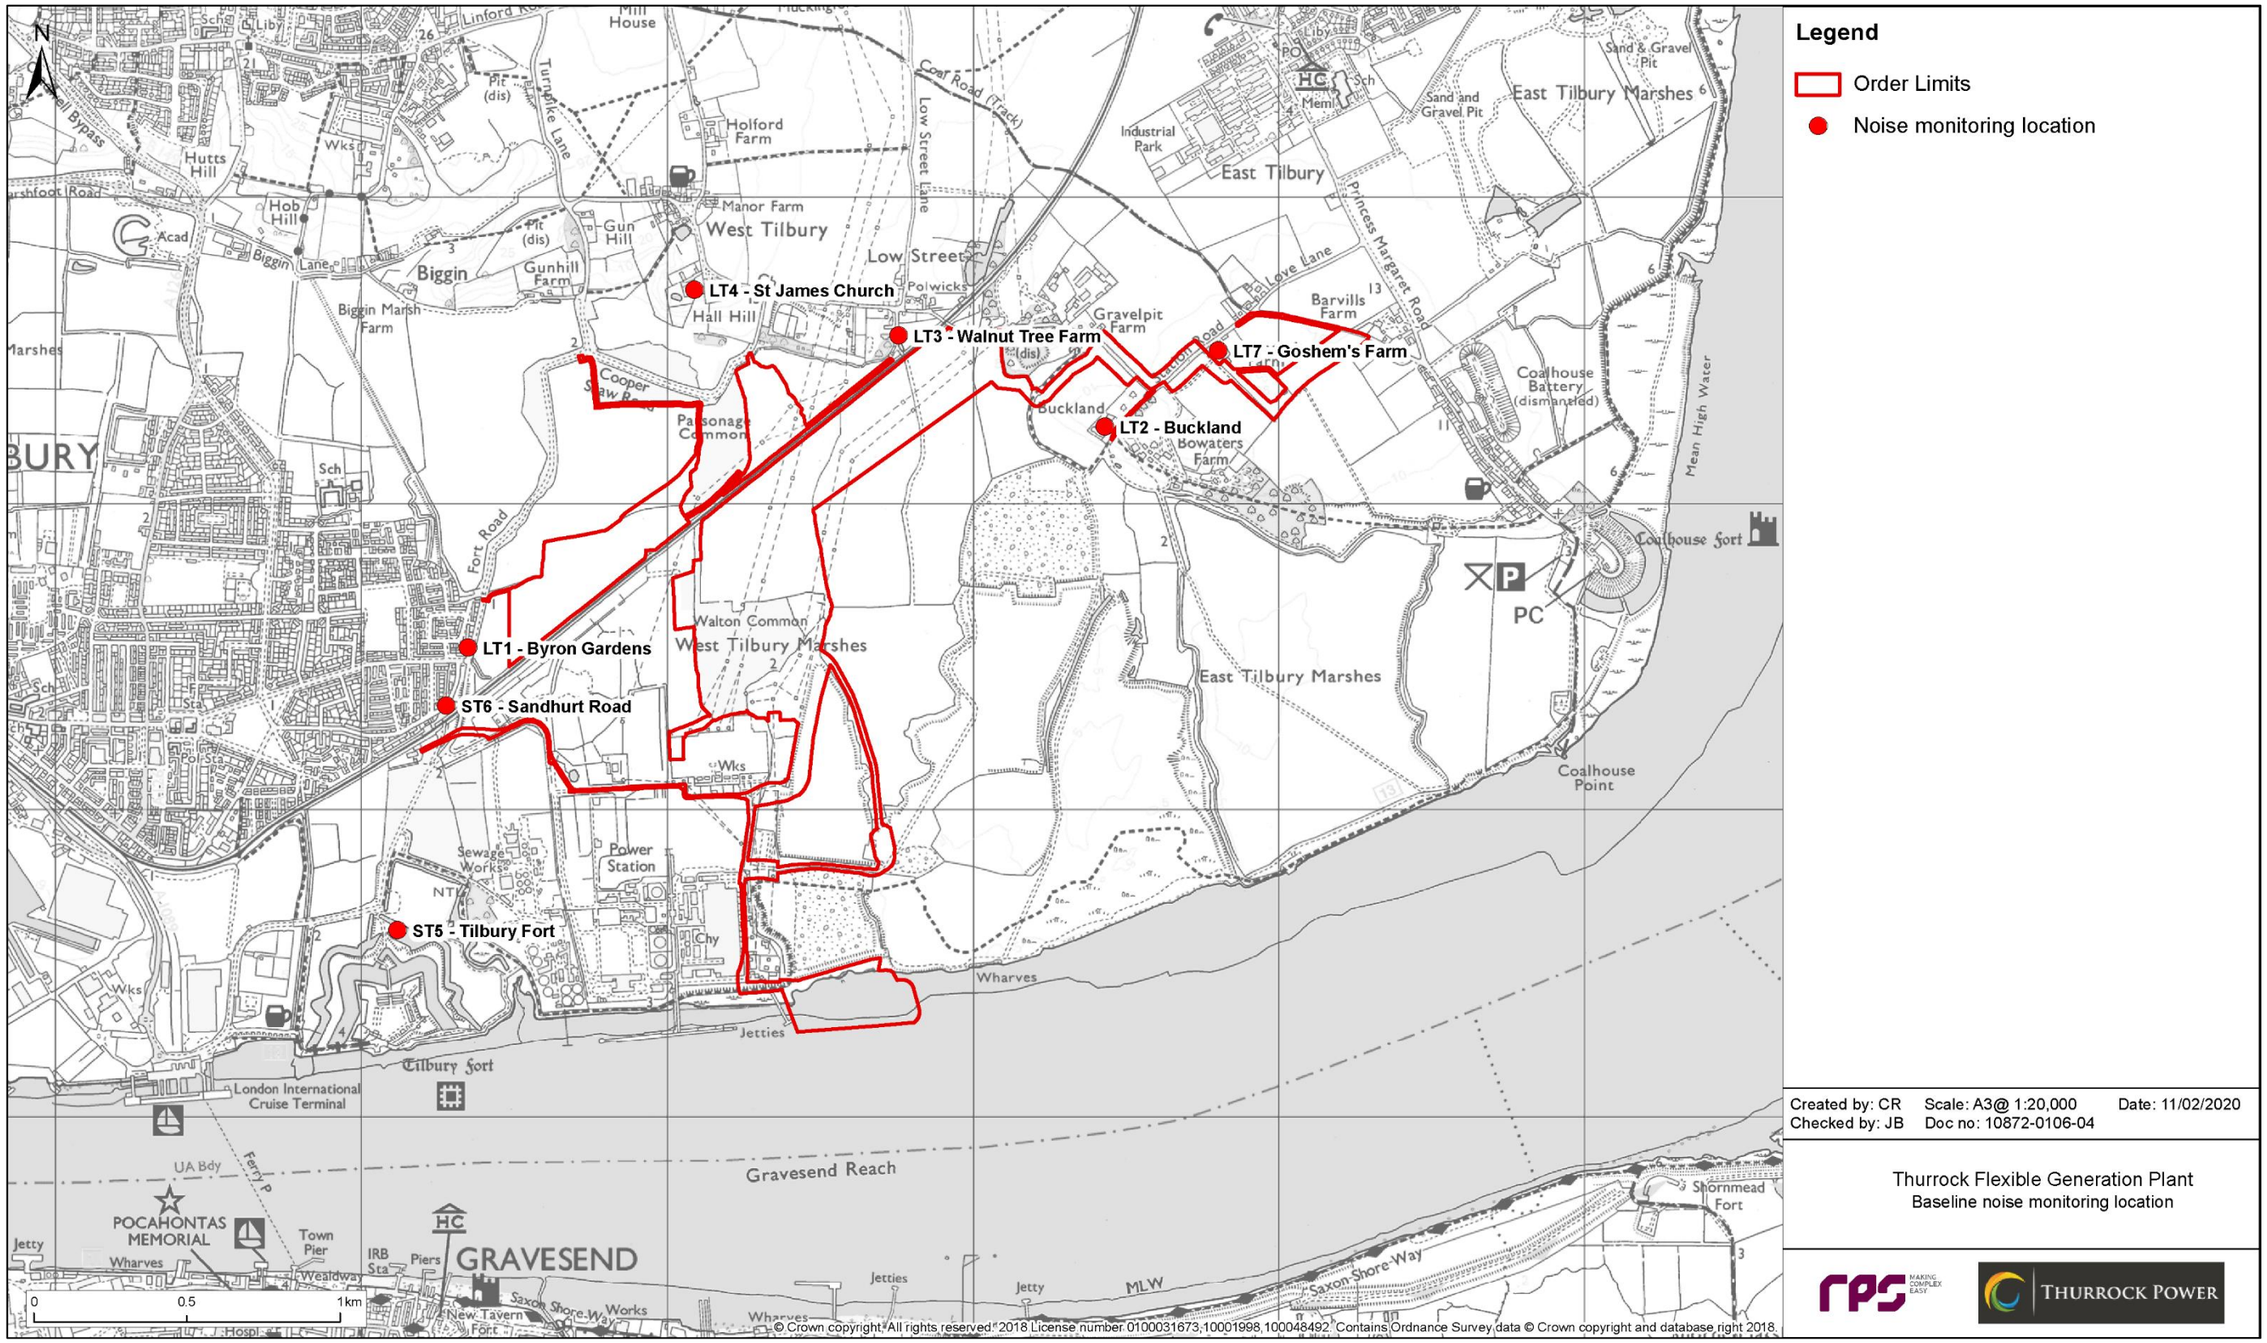

Figure 2.1: Baseline survey locations.

2.3 Baseline survey procedure

2.3.1 Long term unattended baseline sound level monitoring was undertaken between Thursday 1st and Wednesday 21st February 2018 at five locations in closest proximity to the proposed development. At each long term survey location, concurrent, short-term, attended surveys were carried out during the day (07:00 – 19:00 hours), evening (19:00 – 23:00 hours) and night-time (23:00 – 07:00 hours) periods. Attended short term surveys were also undertaken at two additional locations.

2.3.2 All sound level monitoring was carried out using one of the following 'Class 1' sound level meters (SLM): Rion NL-52, Rion NA-28 or Rion NL-31. Each SLM was checked for calibration prior to and immediately following the survey with no significant deviation found. At the long term monitoring locations, continuous data were logged of the fast time weighted, A-weighted, broadband sound pressure levels in 100 ms periods. Short-term attended survey data were logged of the fast time weighted, A-weighted, broadband sound pressure levels in 15 minute periods.

2.3.3 The long term surveys were established during the day and observations made of sources and other conditions in accordance with the requirements of British Standard (BS) 4142:2014+A1:2019 'Methods for rating and assessing industrial and commercial sound' (British Standards Institution (BSI), 2019). As a minimum, the following noise parameters were recorded; L_{Aeq}, L_{Amax}, L_{A10} and L_{A90}. Third octave band measurements were carried out at all locations, with the exception of ST6, to determine the frequency content of the baseline sound. It is considered that spectral data acquired at LT1 is representative of ST6.

2.3.4 In addition to each long term survey location, concurrent attended surveys were carried out during the day (07:00-1900), evening (19:00-23:00) and night-time (23:00-07:00) periods. Short-term attended surveys consisted of the following: three 15 minute discontinuous periods during the daytime; one 15 minute period during the evening; and three 15 minute periods during the night-time.

2.3.5 Long term surveys were undertaken following guidance contained in BS 7445 2:1991 'Description and measurement of environmental noise, Part 2: Guide to the acquisition of data pertinent to land use' (BSI, 1991).

2.3.6 Meteorological conditions were monitored during the long-term surveys with an unattended weather station installed at LT2. Average wind speeds did not exceed 5 m/s during the survey period. There were no significant periods of precipitation. Some limited light precipitation was recorded on 2nd February 2018 however this did not have a significant influence on the measured sound levels. Therefore no data have been excluded from the dataset due to adverse weather conditions.

2.3.7 Meteorological conditions were also measured during each short-term attended measurement using a hand held anemometer.

3. Baseline Survey Details and Results

3.1.1 Survey record sheets for each survey location detailing the position of the noise monitors are presented in Annex A. Time histories of the measured sound levels and meteorological conditions during the survey period are presented in Annex B. Results of the short term attended monitoring are presented in Annex C.

4. Discussion of Results

4.1 Determining representative baseline levels

4.1.1 To ascertain the typical sound levels at the measurement locations, time history plots have been produced and presented for each long term monitoring position. These are presented with the summary results tables in Annex B. The summaries of results in Annex B are based on analysis of the measured sound levels processed into 15 minute samples.

4.1.2 Representative baseline sound levels will be determined, where possible, from long-term monitoring survey locations. For receptor locations where long-term monitoring was not undertaken, the baseline sound levels will be determined from short-term survey data. The data obtained will be analysed and compared against other datasets in order to obtain a representative baseline sound level.

4.2 Operational noise assessment

4.2.1 BS 4142:2014+A1:2019 requires that the background sound levels adopted for the assessment be representative for the period being assessed. The Standard recommends that the background sound level should be derived from continuous measurements of normally not less than 15-minute intervals, which can be contiguous or disaggregated. However, the standard states that there is no 'single' background sound level that can be derived from such measurements. It is particularly difficult to determine what is 'representative' of the night-time period because it can be subject to a wide variation in background sound levels between the shoulder night periods. The accompanying note to paragraph 8.1.4 states that:

"a representative level ought to account for the range of background sounds levels and ought not automatically to be assumed to be either the minimum or modal value".

4.2.2 In determining representative baseline noise levels for receptors identified within the Environmental Statement, it will be necessary to analyse each location individually to ensure the most representative level is considered. BS 4142:2014+A1:2019 states that:

"In using the background sound level in the method for rating and assessing industrial and commercial sound it is important to ensure that values are reliable and suitably represent both the particular circumstances and periods of interest. For this purpose, the objective is not simply to ascertain a lowest measured background sound level, but rather to quantify what is typical during particular time periods."

4.3 Construction noise assessment

4.3.1 To determine the most representative ambient sound levels, the equivalent continuous A-weighted sound pressure level, L_{Aeq}, will be calculated based on standard construction hours and presented as a logarithmic average of the 15 minute period data over the relevant time periods.

	Meter reading	94.0	94.0

Description of site (location of equipment, general surroundings, nature of ground between NSR and sound source(s) (hard/ soft ground, topography, intervening features, reflecting surfaces))

ST6	Layby off residential street, adjacent to railway and small industrial yard (likely HGV storage), broken concrete/asphalt ground bordered in scrubland.

1 Day, 2 Evening, 3 4 5 Night, 6 7 Day

Observations Log

Measurement + start time	Description of sound environment (principal environmental and natural sound sources, which sources are dominant, character of the sound environment cf. to the character of the new source)	Weather: Wind Speed (m/s)	Wind Direction	Cloud cover (oktas)	Temp. (degrees C)	Relative Humidity (%)	Likely temp. inversion?	Precipitation	Fog	Ground cover (Wet / Frozen / Snow)
1 17:12	Main road dominant, distant road apparent, distant planes. Train @ +7mins	2.5	W	8	6°C	-	'	Light	'	
2 21:45	Distant motorways, very occasional local traffic, railway powerlines hum, Trains @ +2min, +8mins	2.5	W	8	4°C	-	'	'	'	Dry
3 23:00	Distant motorways, very occasional local traffic, railway powerlines hum	3.0	W	8	4°C	-	'	'	'	Dry
4 00:08	Distant motorways, very occasional local traffic, railway powerlines hum	2.0	W	8	2°C	-	'	'	'	Dry
5 01:25	Distant motorways, very occasional local traffic, railway powerlines hum	2.0	W	8	2°C	-	'	'	'	Dry
6 09:30	Distand road and aircraft, car idling nearby. Scraping (shovels on road surface). Car alarm and train together @+12mins	3.0	W	6	6°C	-	'	'	'	Dry
7 11:35	Distant roads, occasional local traffic	2.5	W	6	6°C	-	'	'	'	Dry

Photographs of Measurement Location

Description of site (location of equipment, general surroundings, nature of ground between NSR and sound source(s) (hard/ soft ground, topography, intervening features, reflecting surfaces))

Tied to fence, scrubland behind farmhouse

Description of sound environment at start of survey (principal environmental and natural sound sources, which sources are dominant, character of the sound environment cf. to the character of the new source)

Wind rustle, metal recycling (continuous), birds, ocassional aircraft. Industrial noise fairly audible, and local road traffic more noticeable here. Car repair garage nearby is audible during the daytime

Description of sound environment at end of survey (principal environmental and natural sound sources, which sources are dominant, character of the sound environment cf. to the character of the new source)

Wind rustle, metal recycling (continuous), birds, ocassional aircraft. Industrial noise fairly audible, and local road traffic more noticeable here. Car repair garage nearby is audible.

Annex C Baseline Survey Results: Short Term Attended Measurements

Table 1: Short term attended measurements – LT1 Byron Gardens.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:47	2	W	7	60	4	1	2	4	1	67	88	71	53	45	0	Occasional but regular traffic on adjacent on Fort Road dominant and cause of LAmax levels (high % HGVs). Distant traffic audible. Distant industry audible.
01/02/2018 21:23	2	W	4	60	8	1	2	4	1	57	83	51	43	41	0	Very occasional but regular traffic on adjacent on Fort Road dominant and cause of LAmax levels (high % HGVs). Distant traffic, v. distant sirens and port activity, v. occasional local traffic, fence rattling. Train @ +5mins. Distant industry.
01/02/2018 23:01	3	W	5	60	6	1	2	3	3	46	69	50	40	38	0	Distant traffic, distant reverse alarm from port, distant aircraft, 2 trains, 1 passenger 1 long freight. Distant industry.
02/02/2018 00:08	3	W	5	60	3	1	2	3	3	45	73	42	38	37	0	Occasional freight train cause of LAmax levels. Distant traffic, distant aircraft. Distant industry.
02/02/2018 01:14	2	W	4	60	2	1	2	3	3	49	75	50	40	38	0	Wind, distant traffic, 2 freight trains cause of LAmax levels. Distant industry.
02/02/2018 10:26	3	W	6	60	6	1	2	4	1	59	80	59	48	44	0	Occasional but regular traffic on adjacent Fort Road dominant and cause of LAmax levels (high % HGVs). Wind rustle, distant aircraft, trains, local traffic, distant and local HGVs. Distant industry.
02/02/2018 11:30	3	W	6	60	7	1	2	4	1	61	81	60	47	42	0	Occasional but regular traffic on adjacent Fort Road dominant and cause of LAmax levels (high % HGVs). Road traffic local and distant, greater proportion of HGVs, voices, distant industry and aircraft, birds
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.1 Daytime ambient levels at LT1 were dominated by local road traffic movements on Fort Road, including a high percentage of HGVs. Night-time ambient levels were dominated by local road traffic movements and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industry. Daytime and night-time maxima affected by local road traffic and/or train movements.

Table 2: Short term attended measurements – LT2 Buckland.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 15:43	2	W	7	60	4	2	2	4	2	52	74	56	50	45	0	Metal recycling continuous, birds, vegetation
01/02/2018 22:12	2	W	4	60	8	1	2	3	1	46	68	49	43	41	0	Distant traffic, vegetation movement
01/02/2018 23:41	3	W	5	60	5	1	2	3	1	42	65	43	40	38	0	Distant traffic, vegetation movement
02/02/2018 00:49	3	W	5	60	2	1	2	3	1	39	58	40	37	36	0	Vegetation movement
02/02/2018 02:05	3	W	3	60	2	1	2	3	1	43	63	45	42	40	0	Vegetation movement
02/02/2018 11:08	3.5	W	6	60	6	2	2	4	2	53	66	56	51	47	0	Metal recycling continuously audible, distant traffic, vegetation

*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant

C.1.2 Daytime ambient levels at LT2 were primarily affected by local farming activity, occasional aircraft overhead and to some extent distant industry (metals recycling facility located on Station Road). Night-time ambient levels were primarily affected by distant traffic and industry. Daytime and night-time background levels were primarily affected by distant traffic and industry, and wind in flora. Daytime and night-time maxima affected by local road traffic and/or train movements.

Table 3: Short term attended measurements – LT3 Walnut Tree Farm.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:34	2	W	7	60	4	2	1	4	1	56	76	60	46	41	0	Local road traffic on Church Road dominant with high % HGVs. Distant aircraft, birds. Quiet when traffic is low
01/02/2018 22:30	3	W	5	60	6	2	1	3	2	52	74	49	40	38	0	Occasional local road traffic movements (cars) on Church Road. Distant traffic, some local traffic, wind rustle, distant aircraft and industry
01/02/2018 23:21	3	W	5	60	6	1	1	3	2	52	78	41	38	37	0	Occasional local road traffic movements (cars) on Church Road. Distant traffic, v. occasional local traffic, vegetation movement. Train @ +2mins
02/02/2018 00:29	3	W	5	60	3	1	1	3	2	48	72	45	37	36	0	Occasional local road traffic movements (cars) on Church Road. Distant traffic, v. occasional local traffic, vegetation movement
02/02/2018 01:44	2	W	4	60	2	1	1	3	2	40	65	42	39	38	0	Occasional local road traffic movements (cars) on Church Road. Vegetation movement
02/02/2018 10:49	3	W	6	60	6	2	1	4	1	63	82	67	52	48	0	Local road traffic on Church Road dominant with high % HGVs. Road adjacent fairly busy, cars and HGVs. Traffic dominant
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.3 Daytime ambient levels at LT3 were dominated by local road traffic movements on Church Road, including a high percentage of HGVs. Night-time ambient levels were dominated by local road traffic movements on Church Road and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources. Daytime and night-time maxima affected by local road traffic on Church Road and/or train movements.

Table 4: Short term attended measurements – LT4 St James' Church.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:51	3	W	5	60	7	1	2	3	1	58	78	54	46	43	0	Distant traffic and aircraft, birds, occasional local traffic on Church Road
01/02/2018 21:51	2	W	4	60	8	1	2	2	1	45	61	46	44	42	0	Distant traffic, wind rustle, dog bark
01/02/2018 23:22	3	W	5	60	5	1	2	2	1	47	72	48	40	39	0	Fox, distant traffic, wind
02/02/2018 00:29	3	W	5	60	3	1	2	2	1	42	73	41	38	37	0	Distant traffic, v. distant industry
02/02/2018 01:47	2	W	4	60	2	1	2	2	1	43	74	42	40	39	0	Wind, light distant traffic
02/02/2018 10:45	3	W	6	60	6	1	2	3	1	58	78	57	47	45	0	Wind rustle, local on Church Road and distant traffic, birds, distant aircraft
02/02/2018 11:51	3	W	6	60	7	1	2	3	1	59	77	59	48	44	0	Wind rustle, local on Church Road and distant traffic, birds, distant aircraft
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.4 Daytime ambient levels at LT4 were primarily affected by local road traffic movements on Church Road and occasional aircraft. Night-time ambient levels were primarily affected by local and distant road traffic movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources, and wind in flora. Daytime and night-time maxima affected by local road traffic and/or aircraft.

Table 5: Short term attended measurements – LT5 Tilbury Fort.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:23	2	W	7	60	4	2	1	2	1	52	65	54	52	50	0	Largely distant road traffic, distant aircraft, distant voices, fence rattle with wind. Train @ +13mins
01/02/2018 17:21	2	W	6	60	8	2	1	2	1	52	69	53	52	50	0	Distant traffic, distant reverse alarm, wind, water, distant aircraft, barges
02/02/2018 09:55	3	W	6	60	6	2	1	2	1	52	66	54	51	49	0	Distant traffic and aircraft, port activity: engines, clanging, alarms
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.5 Daytime ambient and background levels at ST5 were primarily affected by local activity, distant traffic and industry. Daytime maxima affected by local activity and/or aircraft.

Table 6: Short term attended measurements – LT6 Sandhurst Road.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 17:10	3	W	5	60	7	2	1	4	1	50	66	53	47	45	0	Roads dominant, local and distant, distant aircraft, train @+7mins.
01/02/2018 21:44	2	W	4	60	8	2	1	4	1	50	73	51	44	43	0	Distant traffic, occasional local traffic on Sandhurst Road close to survey location and Fort Road, railway power lines humming. Train @ +2mins, +8mins.
01/02/2018 22:59	3	W	5	60	6	2	1	3	3	57	90	59	42	41	0	Distant traffic, occasional local traffic on Sandhurst Road close to survey location and Fort Road, railway power lines humming.
02/02/2018 00:06	3	W	5	60	4	2	1	2	3	41	68	42	40	39	0	Distant traffic, railway power lines humming.
02/02/2018 01:23	2	W	4	60	2	2	1	2	3	50	70	48	41	40	0	Railway power lines humming.
02/02/2018 10:26	3	W	6	60	6	2	1	4	1	53	71	55	47	45	0	Distant roads and aircraft, car idling nearby. Car alarm and train together @ +12mins.
02/02/2018 11:31	3	W	6	60	7	2	1	4	1	52	77	54	47	44	0	Distant roads and aircraft, occasional local traffic on Sandhurst Road close to survey location and Fort Road.
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.6 Daytime ambient levels at ST6 were dominated by local road traffic movements on Fort Road, including a high percentage of HGVs. Night-time ambient levels were dominated by local road traffic movements and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources. Daytime and night-time maxima affected by local road traffic and/or train movements.

Table 7: Short term attended measurements – LT7 Goshem's Farms.

Start time	Local weather					Subjective audibility (0 – 4)*				Sound pressure level, dB					No. of pauses	Comments
	Wind Speed, ms^{-1}	*Wind Direction*	*Temperature, °C*	*Humidity, %RH*	*Cloud, Octants*	*Industry*	*Wind in flora*	*Road*	*Other (trains/aircraft)*	L_{Aeq}	L_{AFmax}	L_{A10}	L_{A50}	L_{A90}		
01/02/2018 16:14	2	W	7	60	4	2	2	3	2	51	68	54	47	43	0	Metal recycling audible, local traffic, distant aircraft, birds
01/02/2018 22:10	2	W	4	60	8	1	2	2	2	50	76	48	40	38	0	Distant traffic, wind, distant industry (not metal recycling)
01/02/2018 23:44	3	W	5	60	4	1	2	2	2	44	73	45	40	37	0	Distant traffic, wind, distant industry(not metal recycling)
02/02/2018 00:52	2	W	4	60	2	1	2	2	2	39	65	40	36	34	0	Distant traffic, wind, distant industry (not metal recycling), distant train
02/02/2018 02:07	3	W	3	60	2	1	2	2	2	43	69	45	40	37	0	Distant traffic and industry (not metal recycling), wind
02/02/2018 11:07	3.5	W	6	60	6	2	2	3	2	60	83	57	48	44	0	Local traffic on Station Road (cause of LAmax levels) and metal recycling: metal clanging, reverse alarm. Distant traffic and aircraft, birds, trains
02/02/2018 12:11	3	W	6	60	8	2	2	3	2	62	84	60	48	44	0	Local traffic on Station Road (cause of LAmax levels) and metal recycling: metal clanging, reverse alarm. Distant traffic and aircraft, birds, trains
*Subjective audibility; 0 = Inaudible; 1 = Just audible; 2 = Audible; 3 = Significant source; 4 = Dominant																

C.1.7 Daytime ambient levels at LT7 were primarily affected by local road traffic movements on Station Road, local commercial activity (vehicle service centre), and to some extent distant industry (metals recycling facility located on Station Road). Night-time ambient levels were dominated by local road traffic movements and rail movements. Daytime and night-time background levels were primarily affected by distant traffic and industrial sources, and wind in flora. Daytime and night-time maxima affected by local road traffic movements.

Appendix C: 2024 Baseline Data

Sound Level Survey Record

Project Name and Number		Thurrock	
Location		LT1	
Purpose of Monitoring		Baseline

Photographs of Measurement Location

Description of site (location of equipment, general surroundings, nature of ground between NSR and sound source(s) (hard/ soft ground, topography, intervening features, reflecting surfaces))

LT1 was deployed at Sandhurst Road, approximately 870 m to the south-west of the site boundary and 90 m south of the original 2018 LT1 survey location on Byron Gardens.

Description of sound environment (principal environmental and natural sound sources, which sources are dominant, character of the sound environment cf. to the character of the new source)

At the time of setting up and collecting the LT1 survey, the following noise sources were noted as affecting the acoustic environment: regular road traffic movements on Fort Road and Brennan Road, occasional aircraft overhead, and local pedestrians.

This calibration was performed by AcSoft Calibration.
AcSoft Calibration is a trading name of AcSoft Ltd, Bedford Technology Park, Thurleigh, Bedford, MK44 2YA.

CALIBRATION METHOD

Method described in instruction IN-02 "Calibration of the sound level meter", issue number 11 date 27.01.2016, written on the basis of international standard EN IEC 61672-3:2013 Electroacoustics. Part 3: Periodic tests.

CALIBRATION RESULTS

The sound level meter submitted for testing has successfully completed the Class 1 periodic tests of IEC 61672-3:2013 (BS EN 61672-3:2013), for the environmental conditions under which the tests were performed.

The results are presented on pages 3 to 6 of this certificate (including measurement uncertainty).

CONFORMITY WITH REQUIREMENTS

On the basis of the calibration results, it has been found that, the sound level meter meets metrological requirements specified in the standard IEC 61672-1:2013 Electroacoustics – Sound level meters. Part 1: Specifications, for class 1.

UNCERTAINTY OF MEASUREMENTS

Uncertainty of measurement has been evaluated in compliance with EA-4/02:2013. The expanded uncertainty assigned corresponds to a coverage probability of 95 % and the coverage factor $k = 2$.

NOTES

1. *The information appearing on this certificate has been compiled specifically for this instrument. This calibration certificate is produced with traceable and advanced equipment which permit comprehensive quality assurance verification of all data supplied herein.*
2. *The measurements in this document are traceable to GUM (Central Office of Measures), Poland*
3. *This calibration certificate shall not be reproduced except in full, without written permission from AcSoft Ltd.*

REFERENCE EQUIPMENT

Description	Manufacturer	Model	Serial Number	Last Calibrated
Signal Generator	Svantek	SV401	124	27.08.2021
Sound & Vibration Analyser	Svantek	SV912AE	15909	22.09.2021
Thermo-Barometer	LAB-EL	LB-706B	912	27.08.2021
Acoustical Calibrator	Svantek	SV30A	83782	17.09.2021
Reference Microphone	GRAS	40AG	235709	31.08.2021
Sound Intensity Calibrator	GRAS	51AB	203319	01.09.2021

CALIBRATION RESULTS Calibration results are as follows:

1. Indication at the calibration check frequency

The sound level meter was calibrated in compliance with the instruction manual. During this process, the indication of this SLM was adjusted to the sound pressure level of the sound level calibrator type SV 30A, No 83782, from SVANTEK. The sound pressure level was corrected by the free-field factor.

Deviation of the acoustic pressure measurement of the A-weighted sound level using the sound calibrator type SV 30A, No 83782, from SVANTEK, was made according to the standard reference conditions: for static pressure 1003 hPa, for temperature 24 °C and for relative humidity 60 %, results:

0.0 ± 0.2 dB

The deviation was determined as a difference between the measured sound level and the sound level corrected by the free-field factor appropriate to mentioned sound calibrator.

2. Self-generated noise with microphone installed

Frequency weighting	A
The highest level of self-generated noise stated in the instruction manual [dB]	n/a
Indication [dB]	n/a

3. Self-generated noise with microphone replaced by the electrical input signal device

Frequency weighting	A	C	Z
The highest expected level of self-generated noise stated in the instruction manual [dB]	15.0	15.0	23.0
Level of self-generated noise [dB]	14.1	14.1	19.5

4. Acoustical signal tests of a frequency weighting C

Frequency	Relative frequency-weighted free-field response	Design-goal frequency weighting	The deviation of frequency weighting	Expanded uncertainty	Acceptable limits
Hz	dB	dB	dB	dB	dB
125.0	93.9	-0.2	0.1	0.3	±1.5
1000.0	94.0	0.0	0.0	0.3	±1.1
4000.0	93.5	-0.8	0.3	0.4	±1.6
8000.0	91.1	-3.0	0.1	0.4	-3.1; +2.5

5. Electrical signal tests of frequency weightings

Frequency	Design-goal frequency weighting			The deviation of frequency weighting			Expanded uncertainty	Acceptable limits
	A	C	Z	A	C	Z		
Hz	dB	dB	dB	dB	dB	dB	dB	dB
63	-26,2	-0,8	0,0	0.1	0.0	0.0	0,3	±1,5
125	-16,1	-0,2	0,0	0.0	0.0	0.0	0,3	±1,5
250	-8,6	0,0	0,0	0.0	0.0	0.0	0,3	±1,4
500	-3,2	0,0	0,0	0.0	0.0	0.0	0,3	±1,4
1000	0,0	0,0	0,0	0.0	0.0	0.0	0,3	±1,1
2000	1,2	-0,2	0,0	0.0	0.0	0.0	0,3	±1,6
4000	1,0	-0,8	0,0	0.0	0.0	0.0	0,3	±1,6
8000	-1,1	-3,0	0,0	0.1	0.1	0.0	0,4	-3,1; +2,1
16000	-6,6	-8,5	0,0	-0.2	-0.2	0.0	0,6	-17,0; +3,5

6. Frequency and time weightings at 1 kHz

	Sound level				Time-averaged sound level
Frequency weighting	A	A	C	Z	A
Time weighting	Fast	Slow	Fast	Fast	-
Indication [dB]	114.0	114.0	114.0	114.0	114.0
The deviation of indication from the indication of A-weighted sound level with Fast time weighting [dB]		0.0	0.0	0.0	0.0
Expanded uncertainty [dB]		0.1			
Acceptable limits[dB]		±0.3	±0.4	±0.4	±0.3

7. Level linearity

Reference level range: HIGH

Expected sound level	Indication	Level linearity error	Expanded uncertainty	Acceptable limits
dB	dB	dB	dB	dB
119.0	118.8	-0.2	0.2	±1.1
118.0	117.9	-0.1		
117.0	116.9	-0.1		
116.0	115.9	-0.1		
115.0	114.9	-0.1		
114.0	114.0	0.0		
109.0	109.0	0.0		
104.0	104.0	0.0		
99.0	99.0	0.0		
94.0	94.0	0.0		
89.0	89.0	0.0		
84.0	84.0	0.0		
79.0	79.0	0.0		
74.0	73.9	-0.1		
69.0	68.9	-0.1		
64.0	63.9	-0.1		
59.0	58.9	-0.1		
54.0	53.9	-0.1		
49.0	48.9	-0.1		
44.0	43.9	-0.1		
39.0	38.9	-0.1		
38.0	37.9	-0.1		
37.0	36.9	-0.1		
36.0	35.9	-0.1		
35.0	34.9	-0.1		
34.0	33.9	-0.1		
33.0	32.9	-0.1		
32.0	31.8	-0.2		
31.0	30.9	-0.1		

8. Toneburst response

Measurement quantity	Time weighting	Toneburst duration	The indications in response to toneburst relative to steady sound level	Reference toneburst response relative to steady sound level	Deviation of measured toneburst response from reference toneburst	Expanded uncertainty	Acceptable limits
		ms	dB	dB	dB	dB	dB
Time-weighted sound level	Fast	200	-1.0	-1.0	0.0	0.2	±0.8
		2	-18.0	-18.0	0.0		-1.8; +1.3
		0.25	-27.1	-27.0	-0.1		-3.3; +1.3
Time-weighted sound level	Slow	200	-7.5	-7.4	-0.1		±0.8
		2	-27.1	-27.0	-0.1		-1.8; +1.3
Sound exposure level	-	200	-7.0	-7.0	0.0		±0.8
		2	-27.0	-27.0	0.0		-1.8; +1.3
		0.25	-36.1	-36.0	-0.1		-3.3; +1.3

9. Peak C sound level

Numbers of cycles in test signal	Frequency of test signal	The deviation of indication	Expanded uncertainty	Acceptable limits
	Hz	dB	dB	dB
One	8000	-0.9	0.2	±2.4
Positive half-cycle	500	0.0		±1.4
Negative half-cycle	500	0.0		

10. Overload indication

Frequency weighting A

The difference between the levels of the positive and negative one-half-cycles input signals that first cause the displays of overload indication	Expanded uncertainty	Maximum value of the difference
dB	dB	dB
0.4	0.3	1.8

SVANTEK

FACTORY CALIBRATION DATA OF THE *SV 307A No. 119011*

with microphone SVANTEK type ST30A No. 125105

IMEI: 352818660663732

1. CALIBRATION (acoustical)

LEVEL METER function; Reference frequency: 1000Hz; Sound Pressure Level: **114.07** dB.

Characteristic	Correct value [dB]	Indication [dB]	Error [dB]
Z	114.07	114.09	0.02
A	114.07	114.09	0.02
C	114.07	114.09	0.02

Calibration measured with the microphone SVANTEK type ST30A No. 125105. Calibration factor: 0.00 dB.

2. LINEARITY TEST (electrical)

LEVEL METER function; Characteristic: A; f_{sin}= 31.5 Hz

Nominal result LEQ [dB]	29.0	30.0	31.0	35.0	40.0	60.0	80.0	85.0
Error [dB]	-0.0	-0.0	0.0	-0.0	0.0	0.0	0.0	0.0

LEVEL METER function; Characteristic: A; f_{sin}= 1000 Hz

Nominal result LEQ [dB]	29.0	30.0	31.0	35.0	40.0	60.0	80.0	100.0	120.0	125.0
Error [dB]	0.1	0.0	0.0	0.0	0.0	-0.0	0.0	0.0	-0.0	-0.0

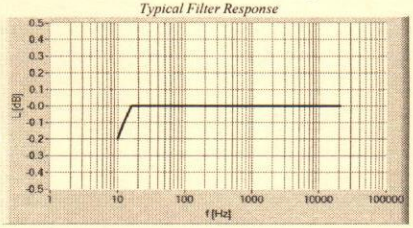
LEVEL METER function; Characteristic: A; f_{sin}= 8000 Hz

Nominal result LEQ [dB]	29.0	30.0	31.0	35.0	40.0	60.0	80.0	100.0	120.0	124.0
Error [dB]	0.0	0.0	-0.0	-0.0	-0.0	-0.0	0.0	0.0	-0.0	-0.0

3. FREQUENCY RESPONSE (electrical)

LEVEL METER function; Characteristic: Z; Input signal =122 dB;

Typical Filter Response



Measured Filter Response
(f-frequency, L-level)

f [Hz]	L [dB]	f [Hz]	L [dB]	f [Hz]	L [dB]
10	-0.1	63	-0.0	4000	-0.0
12.5	-0.0	125	-0.0	8000	-0.0
16	0.0	250	-0.0	16000	-0.0
20	0.0	500	-0.0	20000	-0.0
25	0.0	1000	-0.0		
31.5	0.0	2000	-0.0		

All frequencies are nominal center values for the 1/3 octave bands

4. FREQUENCY RESPONSE (acoustical)

LEVEL METER function; Characteristic: Z; Input: 90 dB;

Frequency [Hz]	20	31.5	63	125	250	500	800	1000	2000
Pressure Response [dB]	0.1	0.2	0.2	0.3	0.3	0.2	0.1	0.1	-0.5
Free Field Response [dB]	0.1	0.2	0.2	0.3	0.2	0.1	-0.0	0.0	0.0

Frequency [Hz]	3150	4000	5000	6300	8000	10000	12500	16000
Pressure Response [dB]	-1.4	-2.2	-3.2	-4.4	-5.8	-7.2	-8.5	-10.2
Free Field Response [dB]	-0.1	0.3	0.0	-0.1	-0.1	-0.5	-1.1	-2.6

5. INTERNAL NOISE LEVEL (electrical - compensated)

LEVEL METER function; Calibration factor: 0dB

Characteristic	Z	A	C
Level [dB]	≤23	≤15	≤15

6. INTERNAL NOISE LEVEL (acoustical - compensated)

LEVEL METER function; Characteristic: A;

Indication [dB]	≤23

Noise measured in special chamber, with reference microphone G.R.A.S type 40AN No. 73421

CONFORMITY & TEST DECLARATION

1. Herewith Svantek company declares that this instrument has been calibrated and tested in compliance with the internal ISO9001 procedures and meets all specification given in the Manual(s) or respectively surpass them.

2. The acoustic calibration was performed using the Sound Calibrator and is traceable to the GUM (Central Office of Measures) reference standard - sound level calibrator type 4231 No 2292773.

3. The information appearing on this sheet has been compiled specifically for this instrument. This form is produced with advanced equipment & procedures which permit comprehensive quality assurance verification of all data supplied herein.

4. This calibration sheet shall not be reproduced except in full, without written permission of the SVANTEK Ltd.

Calibration specialist: Cezary Dardziński .....

Test date: 2022-05-27

QUOTATION - Stage 1

Subject:	*Your reference:*	*Our reference:*	*Date:*
Thurrock Flexible Generation Plant - 59 pcs vent. set	Ventilation System 64.2000	103079, rev. B	March 12, 2024

Dear Ms. Atkins,

We refer to your request to quote for ventilation systems, based on a very high level of ventilation flow: air inlet= 124,560 m³/ h and air outlet= 105,260 m³/ h.

Although we feel that this amount of air flow is way too much, we offer this so that you can compare it.

In a later stage, you can decide what the final air flow must be.
Of course, we are open and willing to advise you on that part (if necessary).

Pos. A : Starting points
Pos. B : 59 pcs air inlet
Pos. C : 59 pcs air outlet
Pos. D : 59 pcs front wall at the air inlet side
Pos. E : Doors for the engine rooms
Pos. F : Budget pricing

Pos. A: starting points

- Engine : Jenbacher, JMS 624.
- Installation : Inside a concrete enclosure, which is provided by others.
- Absorption : There is no absorption inside the engine rooms.
- Dimensions enclosure : L x W x H = approx. 16,500 x 4,850 x 4,000 mm.
- Air inlet flow : approx. 124,560 m³/h; including combustion air.
- Air outlet flow : approx. 105,260 m³/h.
- Air inlet : Installed horizontally at one end of the engine room.
- Air outlet : Installed vertically, with horizontal outlet, on the roof of each engine room.
- Filters : Included.
- Fans : Installed in the air inlet.
- Max. over pressure : 150 Pa.

PDF-XChange Editor Click to BUY NOW! www.tracker-software.com

PDF-XChange Editor Click to BUY NOW! www.tracker-software.com

- Acoustic requirements : Air inlet : Lw= 86 dB(A)/ each.
  : Air outlet: Lw= 89 dB(A)/ each.
  Measured under free field conditions.

All acoustical calculations are based upon following sound spectrum (Lp/ Lw) of the genset (other sounds from piping and flue gas ducts are excluded).

	31	63	125	250	500	1k	2k	4k	8k	Hz
Genset Lp@ 1m	90	97	103	101	96	95	94	96	97	dB
Genset Lw	113	120	126	124	119	118	117	119	120	dB

Noise Levels Gensets:
Unsilenced noise levels for the genset according to Jenbacher Technical Description Cogeneration Unit JMS 624, ytd. 2022 Engine tolerance is +/- 3 dB.
We have not calculated with these tolerances.

General:
- Design based on the technical specifications (SEL-THU-D-ME-SPC-0002 Technical Specification) and the starting points as described above.
- Design changes may be implemented during detailed design based upon value engineering.
- The accuracy of the given noise data determines the quality of the noise calculations. The calculations have been made with the given average noise levels.
- All plant sound pressure levels are in free field conditions with one engine running and excluding any influence from structure born noise and/or other noise sources.
- When measurements are taken on several points the average level will be determined. Measurements taken outside the airflow to avoid influence of airflow on measured values.
- All plant sound pressure level limits are at full load operating conditions.
- All plant sound pressure level limits are at the mitigated level with noise control installed.
- Any noise measures or calculations in addition to the ventilation systems are excluded.

Pos. B: description air inlet
Removable air inlet section, completely supplied as one unit, to be lifted into position with a crane. In the clear opening a steelwork framing will be provided (= pos. D).

Overall outside dimensions approx. W x H x L = 3,700 x 3,650 x 2,850 mm (excl. fans).
The side walls/ roof of the unit are built-up as soundproof panels to avoid noise break-out, made in pre-galvanised steel sheet. Infill of semi-rigid fibre slabs offering excellent strength and resistance to erosion. Material is inert, non-hygroscopic, vermin proof, does not support bacteriological growth and has a Class 1 rating for surface spread of flame acc. to BS 476 [Part 7, 1971].

Air inlet unit

PDF-XChange Editor
Click to BUY NOW!
www.tracker-software.com

The air inlet unit consists of following components:

Weather louvers

Front face entry external weather louvres as a protection against the direct ingress of rain, leaves and birds into the air inlet opening. Over a single face the air speed would be approx. 3.0 m/s.

Filters

25 pcs pocket filters with filter class ISO Coarse 60% (acc. ISO 16890) (former class G4). Low initial differential pressure and high dust holding capacity. Quick installation and filter changing times due to easy, safe handling. Filter elements are installed in a standard cell frame with four clamping elements for secure sealing between the frame and the filter element. Advised pressure difference to exchange filter units is 150 – 180 Pa.
Door at the side of the air inlet section to exchange the pocket filters.

Attenuator

Attenuator part with splitter type silencers made from pre-galvanised sheet steel.

Volume dampers

5 pcs air volume dampers, each with 1 actuator, 24V or 230V, spring open, electrically closed, accessible from within the genset compartment. Damper operation controlled by generator control unit. Each of the damper is wired out to one central junction box. Wiring to control the unit to be provided by others.

Fans

5 pcs fans, suitable for frequency control [electrical control unit by third party]. Fans are axial fans, diameter 900 mm, with 7.5 kW motor (NON ATEX).
The fans will each have an emergency start/ stop button, wired to a common junction box.

front side of air inlet (without louvers)

back side of air inlet

PDF-XChange Editor Click to BUY NOW! www.tracker-software.com

PDF-XChange Editor Click to BUY NOW! www.tracker-software.com

Pos. C: description air outlet
Fixed mounted vertical air discharge section, with horizontal outlet, on top of the concrete roof of the engine room.

Acoustic air outlet unit with overall outside dimensions approx. W x H x L = 3,200 x 3,200 x 4,000 mm.

The opening in the roof of the concrete enclosure has to be provided with a concrete upstand to install the rain collar including the silencer on.

"horizontal" outlet

"horizontal" outlet

The air outlet consists of following components:

Damper plenum
Dimensions plenum: W x H x L = 3,200 x 3,200 x 355 mm.
Dampers accessible from inside the genset compartment.
Dimensions dampers: 2 pcs W x L = 2,000 x 1,335 mm. Including Belimo actuator, spring open, electrically closed. Accessible from within the genset compartment. Damper operation controlled by generator control unit [wiring to control unit by others].

Bottom flange / rain collar:
The silencer is provided with a reinforced bottom flange/ rain collar. It is installed on top of the concrete upstand. There is no need for a second/ separate rain collar.
Rain collar: See photo.

bottom flange/ rain collar

PDF-XChange Editor Click to BUY NOW! www.tracker-software.com

PDF-XChange Editor Click to BUY NOW! www.tracker-software.com

Silencer

A rectangular absorption silencer is installed vertically on the roof curb.
W x H x L = 3,200 x 3,200 x 1,400 mm.

Horizontal outlet

The horizontal outlet unit is installed on top of the vertically positioned attenuator, including bird screen.

Pos. D: description front wall at the air inlet side

At the air intake side of the enclosure, a steel frame including an acoustic top- and side panel will be installed. The acoustic isolation will be equivalent to the isolation values of the air inlet to achieve the same noise requirements.
The dimensions of the complete frame set is approx. W x H = 4,800 x 3,900 mm (exact dimensions to be determined) incorporating a single door plus closure panels. The door is quoted separately (= Pos. E).

Front wall

Materials:

- Ducts : Pre-galvanised sheet steel, no painting.
- Attenuators : Pre-galvanised sheet steel, no painting.
- Weather louvers : Pre-galvanised sheet steel, in RAL colour, with bird protection.
- Multi-leaf dampers : Pre-galvanised sheet steel, with Belimo actuator.
- Steel profiles : Galvanized.
- Purchased parts : In manufacturer standard.

Conservation/ Painting/ Colour:

Weather louvers and exterior ventilation parts are coated in C4.
Colour: any RAL colour of your choice (except metallic and/ or signal colours)
A maintenance manual will be delivered.

- Weather louvers are powder coated.
- Other ventilation parts are wet painted.
- Wall panels: wet coated.
- Other components: unpainted
- Purchased items: in manufacturer standard.

Pos. E1: doors (not fire rated)

Engine rooms:
Per engine room 2 single personnel doors and 1 double equipment door are included; type AL-D/D45.

Noise reduction Rw = 45 dB.

The single doors and the active door leaf of the double door are provided with an anti-panic bar on the inside and a door handle on the outside.
The passive door leaf of the double door is provided with an espagnolette lock on the inside.

single door

double door

Door provided with:
- Double sealing with special rubber design.
- Complete with door frame from 2 mm thick steel.
- Lever latch on the outside and emergency lever on the inside.

Dimensions (clear wall opening[1]):
- Engine room intake end : 59 pcs single door : W x H = 1,044 x 2,421 mm.
- Engine room discharge end : 59 pcs single door : W x H = 1,044 x 2,421 mm.
- Engine room discharge end : 59 pcs double door : W x H = 1,444 x 2,421 mm.

[1]) As per our manual 'Building tolerances for wall openings' rev.1.1. Available on request.

Pos. E2: doors (fire rated EI2, 60 minutes)
Per engine room 2 single personnel doors and 1 double equipment door are included; type AL-D/D50.

Noise reduction Rw = 50 dB.

All door leaves are rated EI2, 60 minutes.
Because of that, all door leaves are provided with a door closer.

The single doors and the active door leaf of the double door are provided with an anti-panic bar on the inside and a door handle on the outside.

Pos. B : Description air inlet

Removable air inlet section, completely supplied as one unit, to be lifted into position with a crane. In the clear opening a steelwork framing will be provided (= pos. D).

Overall outside dimensions approx. W x H x L = 3,300 x 3,450 x 2,750 mm (excl. fans).
The side walls/ roof of the unit are built-up as soundproof panels to avoid noise break-out, made in pre-galvanised steel sheet. Infill of semi-rigid fibre slabs offering excellent strength and resistance to erosion. Material is inert, non-hygroscopic, vermin proof, does not support bacteriological growth and has a Class 1 rating for surface spread of flame acc. to BS 476 [Part 7, 1971].

The air inlet unit consists of following components:

Weather louvers

Front face entry external weather louvres as a protection against the direct ingress of rain, leaves and birds into the air inlet opening. Over a single face the air speed would be approx. 3.0 m/s.

Filters

25 pocket filters with filter class G4 (acc. ISO 16890 ISO Coarse 60%). Low initial differential pressure and high dust holding capacity. Quick installation and filter changing times due to easy, safe handling. Filter elements are installed in a standard cell frame with four clamping elements for secure sealing between the frame and the filter element. Advised pressure difference to exchange filter units is 150 – 180 Pa.
Door at the side of the air inlet section to exchange the pocket filters.

Attenuator

Attenuator part with splitter type silencers made in pre-galvanised sheet steel.

Volume dampers

4 air volume dampers, each with 1 actuator, spring open, electrically closed, accessible from within the genset compartment. Damper operation controlled by generator control unit. Each of the damper is wired out to one central junction box. Wiring to control the unit to be provided by others.

Fans

4 fans, suitable for frequency control [electrical control unit by third party], Fans are axial fans, diameter 900 mm, with 7.5 kW motor (NON ATEX).
The 4 fans will each have an emergency start/stop button, wired to a common junction box.

Pos. C : Description air outlet

Fixed mounted vertical air discharge section, with horizontal blow out, on top of the concrete roof of the engine room.

Acoustic air outlet unit with overall outside dimensions approx. W x H x L = 2,800 x 2,400 x 3,000 mm.

The opening in the roof of the concrete enclosure has to be provided with a concrete upstand to install the rain collar including the silencer on.

The air outlet consists of following components:

Damper plenum

Dimensions plenum: W x H x L = 2,400 x 2,800 x 355 mm.
Dampers accessible from inside the genset compartment.
Dimensions dampers: W x L = 2,000 x 1,995 mm. Including Belimo actuator, spring open, electrically closed. Accessible from within the genset compartment. Damper operation controlled by generator control unit [wiring to control unit by others].

Bottom flange / Rain collar

Dimensions outlet channel W x H = 2,800 x 2,400 mm
Rain collar: See photo* on right-hand side.
To be mounted on top of the concrete upstand

*this photo shows a so called 'penthouse' outlet

Silencer

Vertically mounted rectangular absorption silencer.
W x H x L = 2,800 x 2,400 x 1,400 mm.

Horizontal blowout

The horizontal blow out unit is assembled on top of the vertically positioned attenuator

Louver

Horizontal outlet is provided with a rain repellent louver as a protection against the direct ingress of rain, leaves and birds into the air outlet.

Our general terms of sales and delivery apply!
Subject to technical modifications

Important remarks / explanatory notes:

(1) Calculations and capacity tests are based on the following standards: condensers/gas coolers EN 327, evaporators/air coolers EN 328, dry coolers EN 1048.

(2) Fluid group 2 according to pressure equipment directive 2014/68/EU
(3) According to the enveloping surface method defined in EN 13487/EN 9614-1; tolerance = +2 dB(A). Applies only for AC fans, AC fans with sine control and EC fans. Noise caused by other control methods, water spraying systems or sound reflexions occurring at the installation site are not taken into account and may result in an increased sound pressure level.
(4) This unit is equipped with fans that meet the efficiency requirements of Directive 2009/125/EC (ErP Directive).
(5) The current consumption can differ in dependence of the air temperature and of the variations of system voltage according to the VDE guidance.
(6) When using the unit in aggressive atmospheres, it is imperative to select the materials according to the specific application, see material recommendation brochure in the GPC programme menu "?".
(7) Dimensions and weights are not valid for all possible options! They may differ for units with accessories or special units (S-...).
(8) Piping (DN = 84.9 mm, TSmax = 100 °C, liquid). Final classification according to pressure equipment directive 2014/68/EU during order processing.

Hendrik Ido Ambacht July 3th 2024

Dear Sirs,

With reference to your inquiry we offer you our free of charge revised budget quotation for:

47 pcs free standing silencer / chimneys with 2 in 1 silencers and flues + ducts.
1 pcs free standing silencer / chimneys with 2 in 1 silencers and flues + 1 duct.

Transport to Tilbury Docks for the whole scope.

Optional ducts in AISI 316L.

This quotation consists of:

Chapter 1 - Technical specification scope.
Chapter 2 - Prices, terms and conditions scope.

Axces Industrial Stacks B.V. is part of the Axces Group, and specialized in the engineering and, production of industrial stacks and flue gas chimneys as well as the connecting ducting or channels.

For a complete overview of the Axces Group see our website: www.axces.com. & www.axces.eu

We trust to have interpreted your requirement correctly and will contact you the soonest,

Best regards,
Axces Industrial Stacks B.V.

Ing. André A.J. Bassant.
Managing Director.

Axces Industrial Stacks is EN 13084-7 & ISO 9001:2015 certified by

1) General

We are a company with totally open design philosophy.
We design in inventor 3d software and use special programs for chimney design.
With clients as Siemens HTT, IV consult (offshore), NEM and a good variety of produced chimney / stacks and steel structures we are proud to say we are confident in this project.

2x 50 m freestanding steelstructures with stainless steel flues made from sandwich panels.

On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN,
deposited in the office of the district court of Rotterdam on january 1st 2008. On request a copy will be send.

2) Design data:

- Type of chimney : Free standing square mast structure with round windshield on new concrete.
- Situation : Windloaded over 20m.
- Design code chimney : Eurocode EN 13084-7
- Earthquake zone : N.a.
- Location : Thurrock UK.
- Type : Welded and Bolted in 2 pieces.
- Emission level flue : 25m.
- Ladders : N.a.
- CEMS : Ports in the ducts.
- **Welding flues : All full penetrant acc. to EN 13084-7.***
- **Welding steel structure : Acc. To EN 3834-2**
- **Welding procedures : Acc. to EN ISO 15614-1.**
- **Identification : CE Marking for steel structure and Flue.**
- Diameter ducts : 600 mm.
- Temperature maximum : 600°C.
- Temperature operating : 360°C.
- Below dew point : At start and stop, several times / year.
- Gas engines : Jenbacher JMS 624.
- Duration : 24/24h .
- Corrosion allowance innerflue : 0mm
- Sound : Required sound level to be 64dB(A) @ 1m from the exhaust.

Noise levels to be considered – and **costed offer** to be provided for each:

Option	Unit	1
Sound Level per Genset Exhaust Stack Outlet	dBA (Lp) @ 1m	64
Sound Level per 2 in 1	dBA (Lp) @ 1m	68
Comment	-	In line with specification

- Noise outbreak : No value specified but limited as much as the design allows.
- Visual requirements : No specific requirements, chimney should be round.
- Number engines : 95 pcs.

On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN,
deposited in the office of the district court of Rotterdam on january 1st 2008. On request a copy will be send.

3) General:

This project is for the engineering, design, production and delivery of 48 free standing silencer / chimneys.
1 set is equipped with 1 duct but in case later engine 96 is installed the silencer / chimney only needs a duct.

The sound requirement is this project is verry strict, our silencer will meet the requirement theoretically.
We like to test 1 silencer before starting the production on all 48.
Hopefully you or the engine supplier can help us with finding an engine which we can use for testing.

[redacted]

After our former offer we present a new design. The design is based on the part of the former offer where we offered the standalone silencer on the roof.

We used your specification as guideline and add our knowledge of exhaust systems to design a system we think fits best in this project.

The required sound attenuation for this project with so much engines creating noise is high.
Our design is based on high attenuation on the flue top but also limit as much as possible the noise outbreak form the outside duct, silencers and flues.

Our idea for this project is the following:

New Axces design is a 2 in 1 freestanding silencer / chimney.

The former 4 in 1 silencer is now rectangle, the 2 silencers are back to back centered in between 2 engines.
The flue gasses are complete separate from the engine turbo to the chimney top.

Starting on the engine turbo's, connection to the engine compensators with a flange.
2 small duct angles into a larger vertical duct.
These part are considered a fixed point and need to be hanging on the concrete roof.

The vertical is going through the a roofcravat and made rain tight with a raincollar.
The cravats we supply to the site, probably made in the UK.

On 5*D from the inlet in the vertical duct is are 2* 3 " Cems connections on 90 degree angle in the horizontal.

After the Cems a flexible compensator to allow for thermal expansion. The entrance to the silencer with a 90° segmented elbow and a flanged connection.

The duct from turbo to silencer is offered in 4mm 16Mo3 and optionally in 6mm AISI 316L
The latter is due to the 7 bars explosion pressure and advise form engine supplier to have a stainless steel exhaust.

On all our offers, contracts and deliveries are applicable:

The square silencer is reflection / absorption type, several internal chambers create the sound reduction.

Both silencers are fully welded connected on the backsides.

The silencers are leading the wind loading forces into the concrete roof on 6 anchoring points.
This connection for now is with resin anchors but need to be engineered in detail with your civil engineer.
Queries info showed civil requires 8 supports each system. Details not known yet.

On top of the silencers there is a transition square to round with a flange. On this flange the chimney / silencer is connected.

The material of the silencers is S235Jr, due to internal e-glass there is no high wall temperature which gives a reason to use high strength steel.

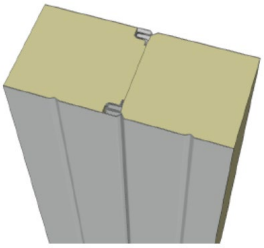
The chimney is over full length acting as a silencer. The round chimney is divided into 2 chambers, 1 for each engine fluegas.
The strong outershell will not be heated up by the flue gas the acoustical part is separate from the outershell.

From inlet to top the silencer and chimney are complete separate per engine.

The outershell is painted in RAL.

At the bottom of each steelstructure there are 2 earthing connections to be connected to earthing system by others.

To limit the outbreak noise and cover the silencers we clad the silencers with acoustical panels in RAL.
Standard with C3 (EN 14299) and optional possible with C5 coating.



Specification on the panels

Element name	Element thickness	Outer shell	Inner cover shell	weight	Thermal resistance	Heat transfer coefficient (Ψ - Joint factor)	
	s	tN	tN	kg / m²	R	U without Ψ	U with Ψ
	mm	mm	mm	kg / m²	m² K / W	W / m² K	W / m² K
HIPERTEC WALL SOUND	60	0,60	0,60	15,3	1,34	0,711	0,731

On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN,

5) Transport:

The silencers – chimneys are prefabricated in our workshop.

The chimneys are combined with 4 pcs in a frame.
The silencers are transported from our workshop to NL.
In NL we apply the acoustical panels and wrap and combine for transport.
For now we offer 2 silencers on top of each other, which means a package 3m width 3.2 m high and 10m length.
Normal transport lengths, no exceptional transport.

We offer 2 * a vessel transport.

Vessel 1 will contain:
Everything for 32 double silencers / chimneys ducts.

Vessel 2 will contain:
Everything for 15+1 double silencers / chimneys ducts.

Power Block	Site Delivery Date	
1 (16 units off)	15/07/2025	VESSEL 1
2 (16 units off)	15/07/2025	
3 (16 units off)	21/07/2025	
4 (16 units off)	21/07/2025	
5 (16 units off)	25/09/2025	VESSEL 2
6 (15 units off)	24/11/2025	

The vessel sails probably will be 2 weeks before ETA on site.

In case the vessel arrives to soon in Tilbury we hope to find a storage area nearby the site.
At this moment this is complete unclear as the ETA Is 1 year away.

Transport from Tilbury Docks to site + offloading at site is an estimate price.
We think for logistics and feasibility best would be if the transport and offloading at site is in the scope of the company who does the install.
They know when parts are expected at site and have grip on the progress.

Estimate transports Tilbury docks to site:

All from vessel 1:
16 trailers with 2 silencers each.
8 trailers with 4 chimneys each.
1 trailer with 32 ducts.

All from vessel 2:
8 trailers with 2 silencers each.
4 trailers with 4 chimneys each.
1 trailer with 16 ducts.

Mentioned price for loading in the docks + transport to site + offloading on site can be removed from the offer if you agree on above.

All parts will have lifting trunnions so loading unloading and install can be done safe and fast.

On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN, deposited in the office of the district court of Rotterdam on january 1st 2008. On request a copy will be send.

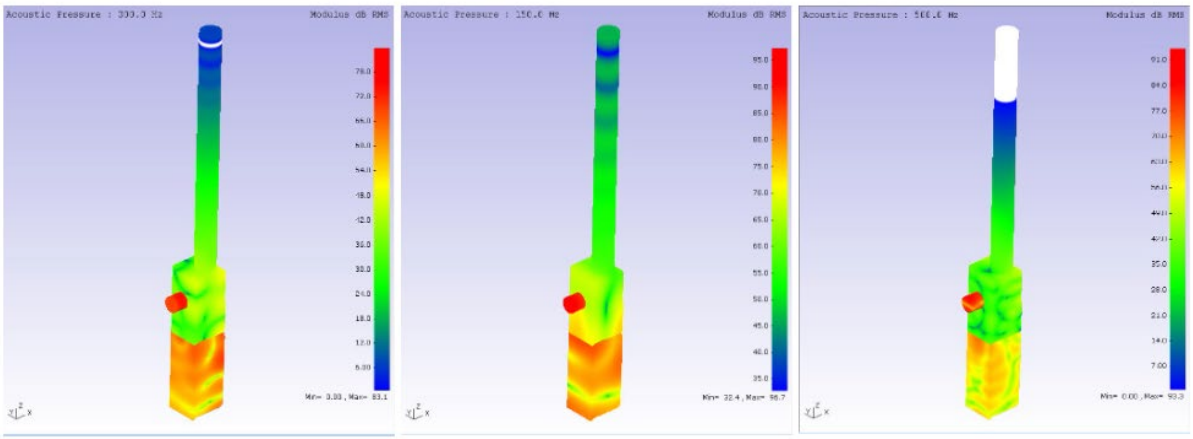
6) Partslist pre-fab parts per 2 engines.

1) 2* Engine connection Y piece.
2) 2* pcs vertical duct.
3) 1 pcs silencer 2 in1.
4) 1pcs chimney silencer.
5) Resin anchors.
6) Bolts nuts washers gaskets.

In the table the preliminary outcome of the acoustical design calculation.

Indication of the acoustical CFD



7) Scope of supply :

- Basic and detail engineering for chimneys acc. to BS-EN 13084-7
- Basic and detail design anchors, supply of normal loads.
- Schedule and planning.
- Documents, MDR, welding, assembly, erection plans etc. **CE marking.**
- Resin anchors for now 48* 16pieces M20 cl. 8.8 galvanized.
- Resin for anchoring and sufficient drills included.

- 48 off silencers 2 in 1 rectangle 3000*1500mm length 10m.
  S235Jr 6mm, acoustical e-glass filling.
  CE marking EN 13084-7
  Nameplate with identification, CE marking, Tag no. etc.
  All flanges as per DIN 86044.

- 95 off ducts and Y pieces D 600mm 16MO3 length as per dwg.
- 95 fixed point constructions hanging support with our Axces system.
- Included each duct 2 * CEMS 3’ socket with cap.

On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN,
deposited in the office of the district court of Rotterdam on january 1st 2008. On request a copy will be send.

- 95 off flexible compensator welded on the pipe.
- Bolts nuts washers, gaskets for T =600C.
- 2 earthing connections each silencer.
- Top transition square -> round 6mm S235Jr.
- Outside blasting + Baril painting.

- Silencers covered with acoustical panel cladding on the mast structures.
- Thickness 60mm.

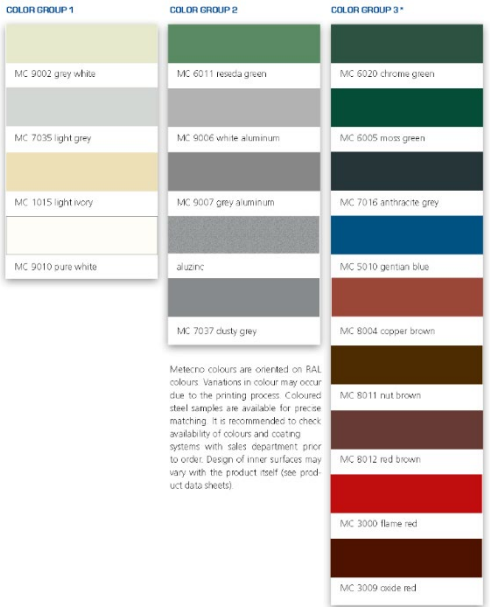
- 48 off chimney silencer diameter 1.5m Length 10m.

- Made from length segmented folded plates 5mm.

- Internally acoustical e-glass covered with carbon steel perforated plates.
- All flanges to be DIN 86044.
  Blasting SA 2.5 outside.

- CE marking EN 13084-7 or UK CA marking depending on delivery time.

- 2 layer C5 painting in RAL outside.
- Lifting trunnions on all parts.
- Transport support frames.
- Mounting and erection description in 3d.
- MDR docs, Declaration of performance, manufacturing data book.
-



On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN,
deposited in the office of the district court of Rotterdam on january 1st 2008. On request a copy will be send.

Indication on the 8 supports of the silencer.
All resin anchors can be drilled during installation.

8) Not in our scope of supply:

- Parts not mentioned in the scope of supply.
- Optional mentioned parts.
- Measure equipment.
- Civil engineering / calculations.
- NDT testing, leakage testing.
- Roofcravats and raincollars.
- Thermal insulation on the duct in the building, we advise insulation matrasses.
- Thermal insulation on the ducts outside the building.
- Insulation matrasses to cover the compensators.

9) General notes:

The silencer and chimney will be built according to Axces standards and Eurocode, we prepare drawings complete with parts list, dimension indications welding details and assembly notes.

On all our offers, contracts and deliveries are applicable:
General delivery and payment conditions published by the Metaalunie, called METAALUNIEVOORWAARDEN,
deposited in the office of the district court of Rotterdam on january 1st 2008. On request a copy will be send.

The final pressure drop will be given after final order clarification and must be taken from the P&ID order documentation.

JENBACHER

connection variant H2

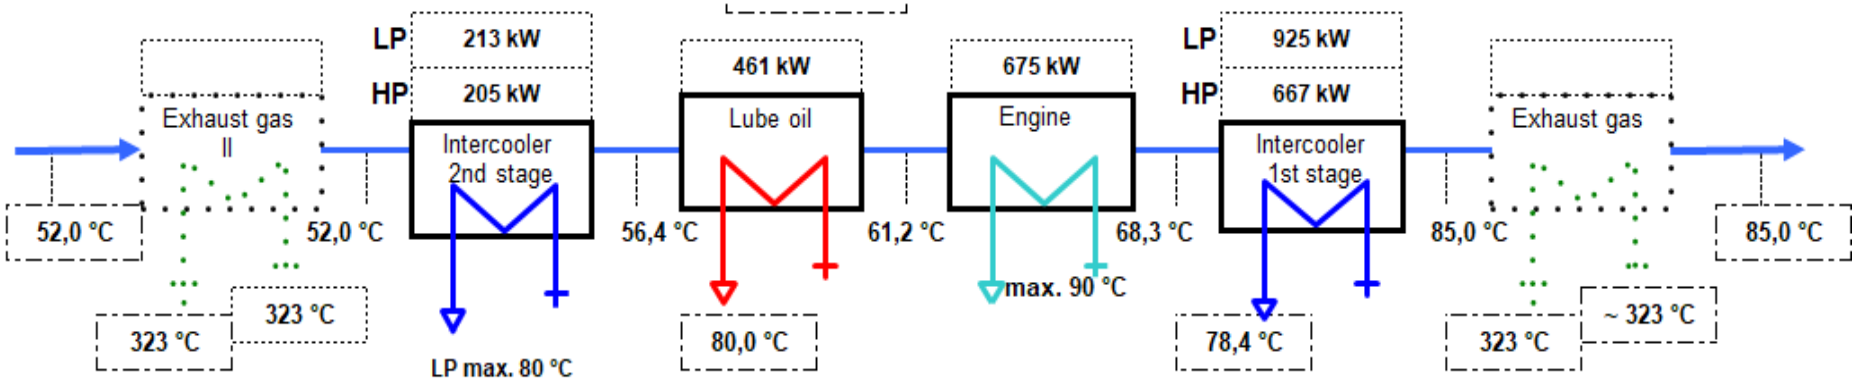
J 624 GS-L312

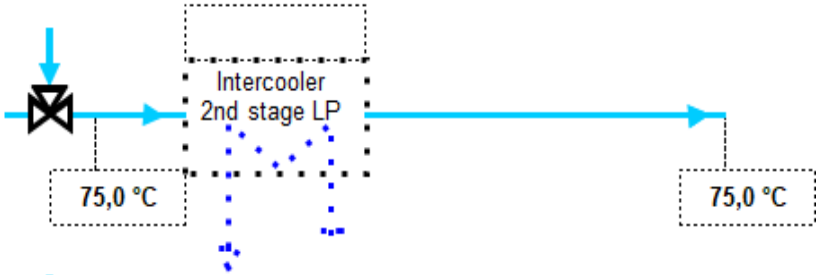
Hot water circuit (calculated with Glycol 40%)

Recoverable thermal output = 3 146 kW

(+12/-8 % tolerance)

Hot water flow rate = 92,7 m³/h



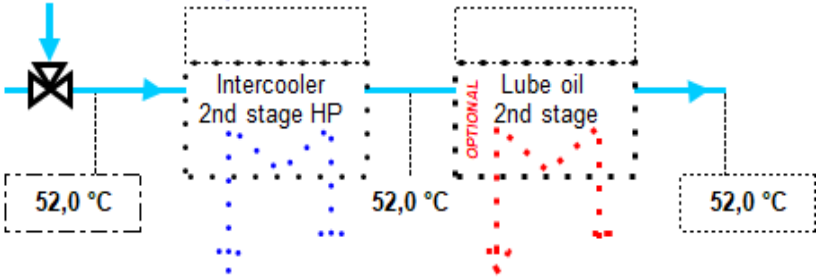


Low temperature circuit (calculated with Glycol 40%)

Heat to be dissipated = 0 kW

(+12/-8 % tolerance)

Cooling water flow rate = 50,0 m³/h



0.10 Technical parameters

All data in the technical specification are based on engine full load (unless stated otherwise) at specified temperatures and the methane number and subject to technical development and modifications.

All pressure indications are to be measured and read with pressure gauges (psi.g.).

[1] At nominal speed and standard reference conditions ICFN according to ISO 3046-1, respectively
[2] According to ISO 3046-1, respectively, with a tolerance of +**5** %.
Efficiency performance is based on a new unit (immediately upon commissioning).Effects of degradation during normal operation can be mitigated through regular service and maintenance work.

[3] Average value between oil change intervals according to maintenance schedule, without oil change amount
[4] At p. f. = 1.0 according to IEC 60034-1:2017 with relative tolerances, all direct driven pumps are included
[5] Total output with a tolerance of +12/-8 %
[6] According to above parameters [1] through [5]
[7] As a guiding value at p.f. 0.8 and only valid for (engine, generator, TCM). Other peripheral equipment is not considered.
[8] Exhaust temperature with a tolerance of ±8 %
Note: an optimised operating mode to minimise methane slip can result in changed exhaust gas data (exhaust gas temperature, NOx emissions, etc.) and must be taken into account in the design of the exhaust gas aftertreatment
[9] Mixture temperature at:
If the engine is designed for intake air temperatures of > 30°C, then the stated mixture heat of the 1st stage is to be increased from 25°C in 2%/°C increments. The additional temperature must be added to the resulting full load point.

Radio interference level
The ignition system of the gas engines complies the radio interference levels of CISPR 12 and EN 55011 class B, (30-75 MHz, 75-400 MHz, 400-1000 MHz) and (30-230 MHz, 230-1000 MHz), respectively.

Definition of output
- ISO-ICFN continuous rated power:
  Net break power that the engine manufacturer declares an engine is capable of delivering continuously, at stated speed, between the normal maintenance intervals and overhauls as required by the manufacturer. Power determined under the operating conditions of the manufacturer's test bench and adjusted to the standard reference conditions.
  - Standard reference conditions:

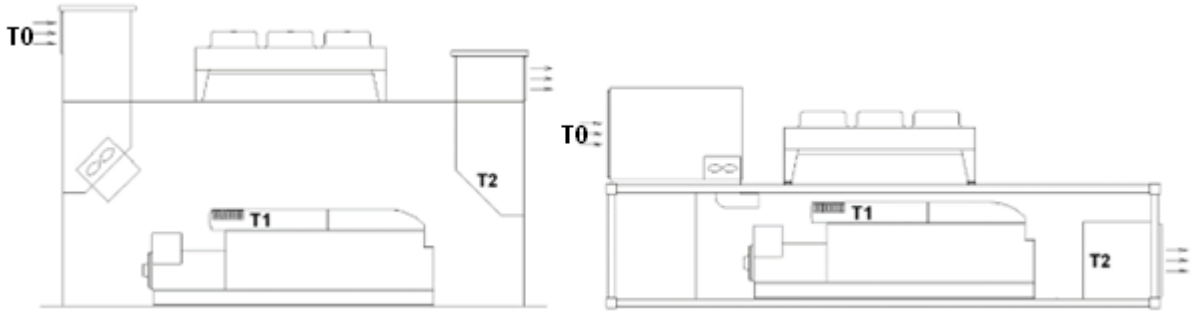
Barometric pressure:	1000 mbar (14.5 psi) or 100 m (328 ft) above sea level
Air temperature:	25°C (77°F) or 298 K
Relative humidity:	30 %

- Volume values at standard conditions (fuel gas, combustion air, exhaust gas)
  Pressure: 1013 mbar (14.7 psi)
  Temperature: 0°C (32°F) or 273 K

Loss of engine performance
a) Performance reduction due to gas quality
If the reference methane number is not reached and the knock control responds, the ignition timing at full performance is adjusted in conjunction with the engine management system; only then is performance reduced.
H2 admixtures in the range of 3–5 Vol% into the natural gas network are generally regarded as non-critical. Prerequisites for this are rates of change according to TA 1000-0300, as well as the knock resistance (minimum methane number) of the natural gas-H2 mixture according to the specification. For reliable compliance with required NOx emissions, the JENBACHER LEANOX^{plus} control is recommended (measurement of NOx emissions and correction of the LEANOX controller). Higher H2 addition rates into the natural gas network must be assessed on a project-specific basis.

b) Performance reduction due to voltage and frequency limits
If the voltage and frequency limits for generators specified in IEC 60034-1 Zone A are exceeded, performance is reduced.

c) Performance reduction due to environmental conditions
Standard rating of the engines is for an installation at an altitude ≤ **500m** and combustion air temperature ≤ **35°C** (T1)
Engine room outlet temperature: **50°C** (T2) -> engine stop



The minimum recommended air change ratio (C) must be observed to maintain according to TA 2300-0030.

Parameters for the operation of JENBACHER gas engines
The genset fulfils the limits for mechanical vibrations according to ISO 8528-9.
The following forms an integral part of a contract and must be strictly observed: **TA 1000-0004, TA 1100 0110, TA 1100-0111, TA 1100-0112**, and **TA 2300-0030.**
Transport by rail should be avoided. See **TA 1000-0046** for further details

Failure to adhere to the requirements of the above-mentioned TA documents can lead to engine damage and may result in loss of warranty coverage.

The engine is tested on the test stand with a specific natural gas. The natural gas as used by the Seller on the test stand may differ from the gas as ultimately used by the Customer. For this reason, performance and efficiency levels, exhaust-gas temperatures, gas consumption, etc. may deviate from the parameters specified in the contract.

Ready for H2 means a possible adaptation up to 100vol% H2 operation. Performance data, timeline and costs can be determined on a project-specific basis.

Parameters for the operation of control unit and the electrical equipment
Relative humidity 50% by maximum temperature of 40°C.
Altitude up to 2000m above the sea level.

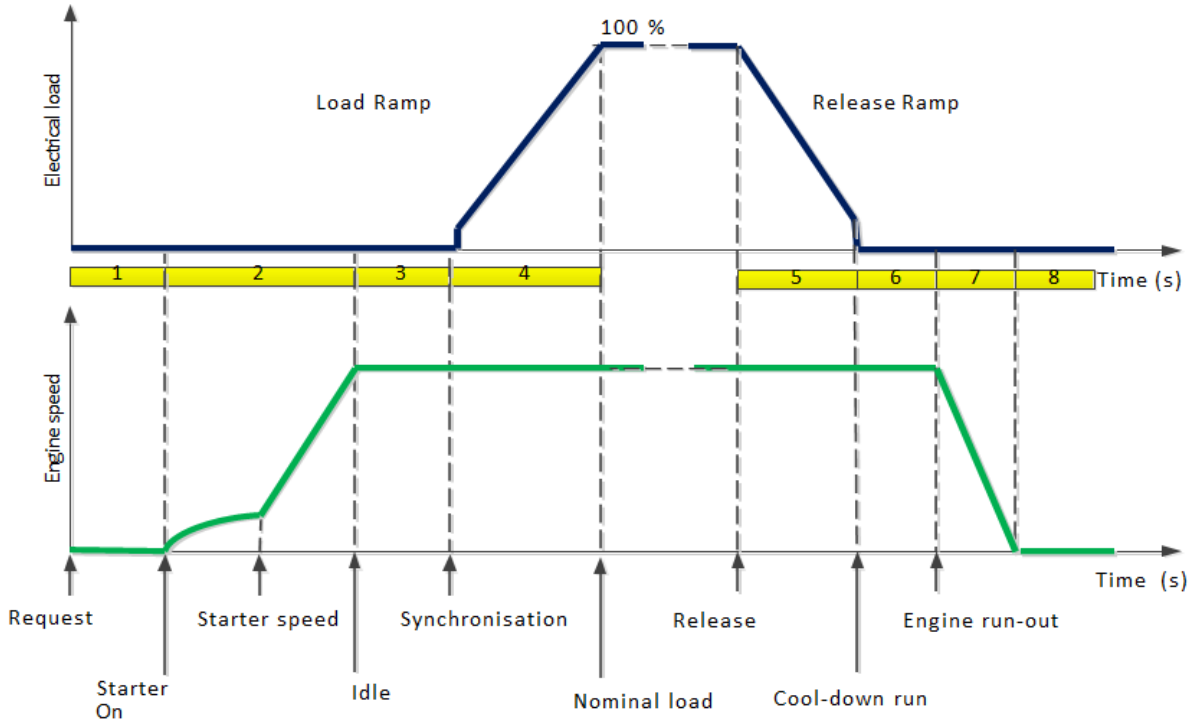
0.20 Mode of Operation

Grid Parallel Mode
The genset is running in parallel to the utility. The unit load can be adjusted via its power control set point or designated option.
Procedure in the event of mains failure:
When the mains monitor relay (protective relay ANSI No. 27, 59, 81, 78- provided either by JENBACHER or the customer) is activated due to a mains failure, the engine is isolated from the mains by opening the generator breaker. The module is shut down without any cool-down run.
Island operation is not available in this case!
The module can be restarted following the restoration of mains power after a 5-minute mains stabilization period.

0.20.01 Guide values for genset - start/stop times and el. load ramps

Basic boundary conditions for engine start:

Engine conditions	Oil temperature (°C / °F)	Cooling-water temperature (°C / °F)
Fast start release	> 27 / 80.6	> 55 / 131
Start enable automatic start		> 37 / 98.6
synchronization release		> 55 / 131



The following time data of the individual start sections up to the nominal load are **guideline values** for a fully automatic start under preheated conditions for mains parallel operation. Only the total start time is observed under the various engine conditions. The individual time periods specified in the table therefore do not necessarily add up to the specification of the total start time in mains parallel operation.

Deviations are possible for special designs.

	J208	Type 3	Type 4	Type 612 – 620	J624
(1) Start preparation [1] *)	0	0	20	70	90
(2) Engage starter until reaching nominal speed [s] *)	20	20	25	40	40
(3) Synchronisation [s] *) **)	1-50	1 – 50	1 – 50	1 – 50	1 – 50
(4) Load application up to nominal load [s] *) **)	180	180	180	160	160
Total start-up time from request to nominal load [s]	<300	<300	<300	<300	<330

*) The times for start-up preparation and synchronisation can vary greatly and depend on project specifications.
) **Fast start function and faster load ramps are available on request.

The following **times for unloading the engine** are guide values for engine/generator combination inertia constant H<1 kWs/kVA (with LS, CGT, TDPS generators) and the hot operating condition.

	J208	Type 3	Type 4	Type 612 – 620	J624
(5) Load reduction ramp [s]	160	160	160	160	120
(6) Cool-down run [s]	60	60	60	10	10
(7) Run-down [s]	60	60	60	60	60
Total time from nominal load to run-down time [s]	280	280	280	220	180
(8A) gas tightness control [s]	<100	<100	<100	<100	<100
(8B) Flushing time exhaust tract after shutdown [s]***)				100	100
(8C) Flushing time exhaust tract after shutdown with SD and WT [s]***)				180	300
(8D) Flushing time exhaust tract after shutdown with SD, WT, SCR and greenhouse [s]***)				225	400
(8E) Blocking time for restart [s]	30	30	30	30	30

***) The exhaust gas purging times apply when the exhaust gas purging fan is installed

The table shows the waiting time between stopping the engine and starting it again, with the gas tightness check (8A), exhaust gas scavenging (8B-D) and blocking time (8E) being carried out in parallel. The flushing times can be extended project-specifically depending on the exhaust system.
It should also be noted that the exhaust gas purge must be performed after each unsuccessful start attempt once the gas valve has been opened. (SD = silencer, WT = heat exchanger)

0.30 General information for connection to the public mains

Technical Instruction TA 1530-0188 describes the - possibly optional - functions and parameters for complying with the boundary conditions defined in the country-specific "Grid Codes".

Network operator-dependent requirements must always be coordinated with JENBACHER.

0.30.10 Generator operating range in mains parallel operation

Frequency:
Normal operation fn +/-2% - without power output reduction
Extended operation: fn +4/-6%- with power output reduction between 2 – 10%/Hz
Frequency-measurement resolution: <= 10mHz (resolution)
Generator - voltage range: +/-10% of generator Un
Generator power factor cos phi at the generator terminals: as specified in "0.03 Generator technical data"

FRT (Fault Ride Through) – capability: at mains connection point
Profile 1: 150ms/30%Un (applies to natural gas and biogas)
Profile 2 (150ms/5%Un) and Profile 3 (250ms/5%Un) upon request.

Requirement:
- mains short-circuit power must be at least 5 x SrE or 50MVA
- FRT capability of the onsite auxiliaries

Extended project requirements and country-specific design are optionally possible after consultation and approval with JENBACHER.

0.30.20 Possible mains operator requests

To protect the generating unit in mains parallel operation, appropriate mains protection monitoring functions are necessary to disconnect the generator from the mains in case of a mains fault.

The mains operator-dependent specifications such as e.g.: voltage and frequency range, active power limitation, load ramps, reactive power limitation and control, protection concept, necessary certification or declarations, process data and interfaces are to be specified in project enquiries and must be agreed with JENBACHER before conclusion of the contract.

- Selectivity assessment, protection tests and recurring tests: on-site by the system operator
- Control power provision via pool operator: on request e.g., primary, secondary, tertiary
- Black start capability and countering in own use: on request
- Power generation system (EZA) controller or central control: on-site or possible on request
- Process data scope / remote control:
  - System data must be provided by the connectee for the mains operator.
  - Remote control interface to the mains operator: on-site
  - Interface specification!

Billing measurements - installation, operation, maintenance and remote data transmission: on-site.

Models of genset and generator: simplified models executed as effective value models for mains parallel operation optionally available.
Model formats: Powerfactory, or PSS/E (as of PP23)
Validated genset models in Powerfactory according to FGW TR3, TR4 and TR8 by a body accredited for this purpose according to DIN EN ISO/IEC 17065

Functional scope of the models in mains parallel operation:
- static voltage stability
- dynamic mains support
- Provision of reactive power
- Behaviour at active power setpoint
- Active power adjustment in the event of overfrequency and underfrequency (LFSM-O, LFSM-U)
- Protective devices and settings

0.30.20.01 Active power adjustment in the event of overfrequency and underfrequency

The following functions are available:
- LFSM-U: Limited Frequency Sensitive Mode - Underfrequency
- LFSM-O: Limited Frequency Sensitive Mode - Overfrequency
- FSM

Reduced power output at overfrequency: (LFSM-O function)
The frequency threshold is freely adjustable from fn + (200 - 500mHz) and the static from 2% to 12%. Unless the relevant mains operator specifies otherwise for the LFSM-O mode, a threshold of fn + 200mHz and a static of 5% is set.

Power increase in the event of underfrequency (LFSM-U function) – (OPTIONAL as of XT4.5)
activated according to the mains operator's specifications
The frequency-sensitive active power feed-in has the effect that the generating plant
also moves permanently up and down on the frequency characteristic curve ("driving on the characteristic curve") in the frequency range between fn - 200mHz (unless otherwise specified by the mains) and fn - 2.5Hz with regard to its maximum possible active power feed-in.
The prerequisite for this is a corresponding power setpoint.

Reduced power output at underfrequency:
below 98% of fn, reduction by standard 10% of maximum capacity per Hz. Reduction up to maximum fn - 6%.
Lower reduction ramps of 2 - 10%/Hz on request
The FSM function is available as an option

The power generation system is capable of continuing to operate at this minimum power when the minimum power for controllable operation is reached.
