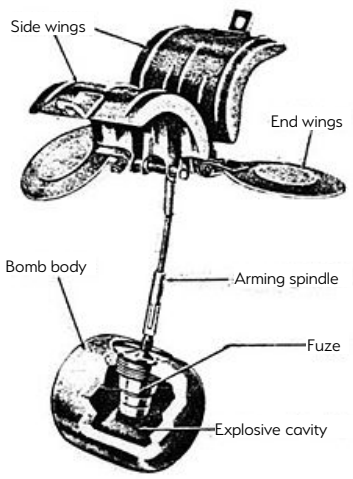
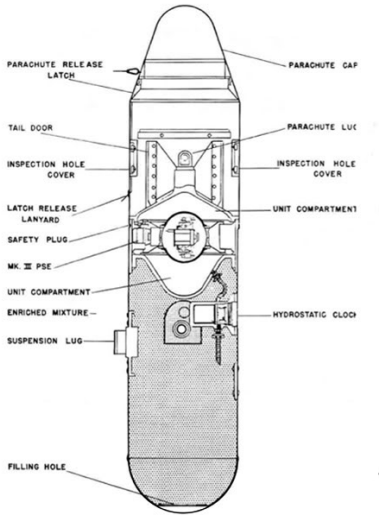
SD2 Anti-Personnel 'Butterfly Bomb'

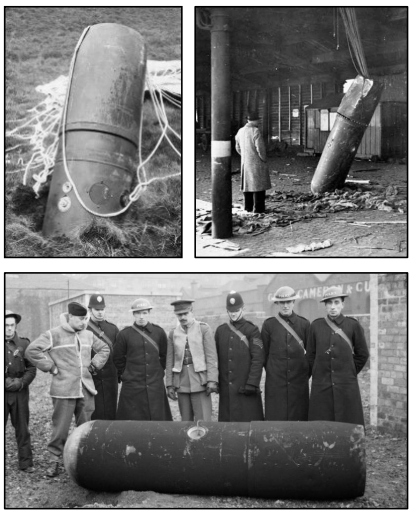
Bomb Weight	Approx. 2kg (4.41lb)
Explosive Weight	Approx. 7.5oz (225 grams) of Amatol surrounded by a layer of bituminous composition.
Fuze Type	41 fuze (time) , 67 fuze (clockwork time delay) or 70 fuze (anti-handling device)
Body Diameter	3in (7.62 cm) diameter, 3.1in (7.874) long
Use	Designed as an anti-personnel/fragmentation weapon. They were delivered by air, being dropped in containers of 23-144 sub-munitions that opened at a predetermined height, thus scattering the bombs.
Remarks	Quite rare. First used against Ipswich in 1940, but were also dropped on Kingston upon Hull, Grimsby and Cleethorpes in June 1943, amongst various other targets in UK. As the bombs fell the outer case flicked open via springs which caused four light metal drogues with a protruding 5 inch steel cable to deploy in the form of a parachute & wind vane, which armed the device as it span.



Parachute Mine (Luftmine B / LMB)

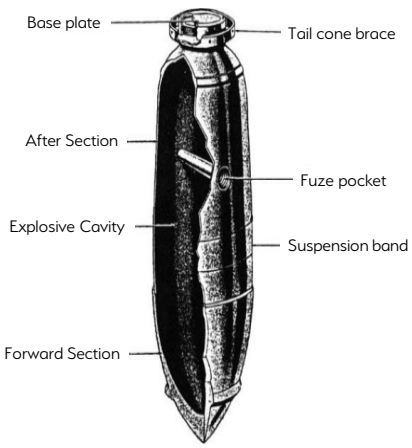
Bomb Weight	Approx. 990kg (2176lb)
Explosive Weight	Approx. 705kg (1,554lb)
Fuze Type	Impact/time delay/hydrostatic pressure fuze
Dimensions	2.64m x 0.64m (3.04m with parachute housing)
Use	Against civilian, military and industrial targets. Used as blast bombs and designed to detonate above ground level to maximise damage to a wider area.
Remarks	Deployed a parachute when dropped in order to control its descent. Had the potential to cause extensive damage within a 100m radius.





SC 1000kg High Explosive Bomb

Bomb Weight	Approx. 993-1027kg (2,189-2,264lb)
Explosive Weight	Approx. 530-620kg (1168-1367lb)
Fuze Type	Electrical impact/mechanical time delay fuze.
Filling	Mixture of 40% amatol and 60% TNT, but when used as an anti-shipping bomb it was filled with Trialen 105, a mixture of 15% RDX, 70% TNT and 15% aluminium powder.
Bomb Dimensions	2800 x 654mm (110 x 25.8in)
Body Diameter	654mm (18.5in)
Use	SC-type bombs were General Purpose Bombs used primarily for general demolition work. Constructed of parallel walls with comparatively heavy noses, they are usually of three-piece welded construction.



1ST LINE DEFENCE

Unit 3, Maple Park,
Essex Road, Hoddesdon,
Hertfordshire. EN11 0EX
Email: info@1stlinedefence.co.uk
Tel: +44 (0)1992 245 020

Client: Concept Engineering Consultants Ltd

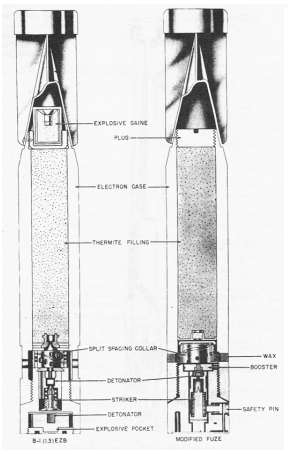
Project: Thorney Lane, Iver

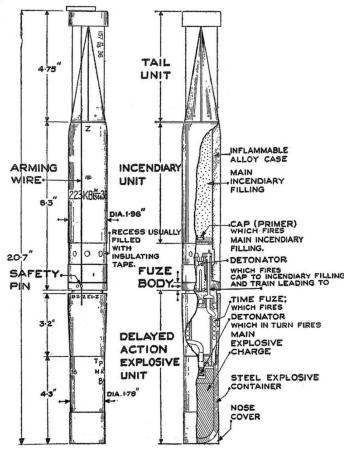
Ref: DA20371-00

Source: Various sources

1kg Incendiary Bomb

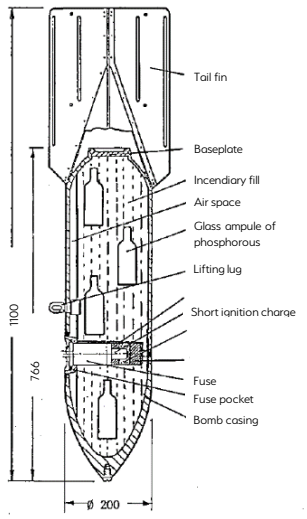
Bomb Weight	Approx. 1.0 - 1.3kg (2.2 and 2.9lb)
Explosive Weight	Approx. 680g (1.5lb) Thermite 8-15gm Explosive Nitropenta
Fuze Type	Impact fuze
Bomb Dimensions	350 x 50mm (13.8 x 1.97in)
Body Diameter	50mm (1.97in)
Use	As incendiary – dropped in clusters on towns and industrial complexes.
Remarks	Magnesium alloy case. Sometimes fitted with high explosive charge. The body is a cylindrical alloy casting threaded internally at the nose to receive the fuze holder and fuze.

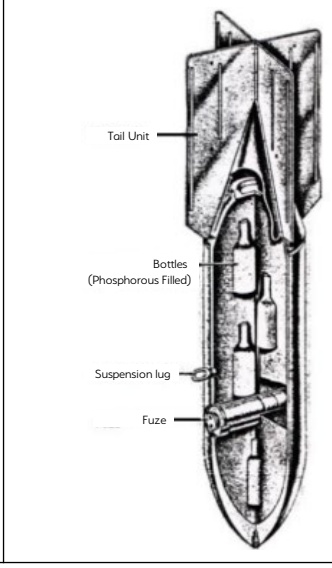




C50 A Incendiary Bomb

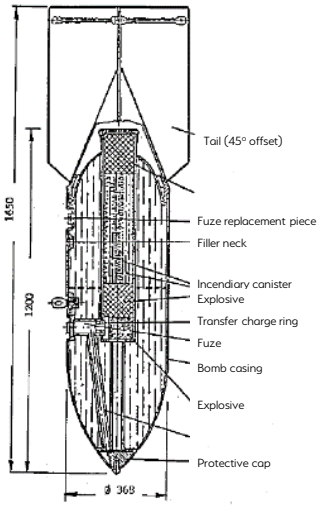
Bomb Weight	Approx. 41kg (90.4lb)
Explosive Weight	Approx. 0.03kg (0.066lb)
Incendiary Filling	12kg (25.5lb) liquid filling with phosphor igniters in glass phials. Benzine 85%; Phosphorus 4%; Pure Rubber 10%
Fuze Type	Electrical impact fuze
Bomb Dimensions	1,100 x 280mm (43.2 x 8in)
Use	Against any targets where an incendiary effect is required.
Remarks	Early fill was a phosphorous/carbon disulphide incendiary mixture.





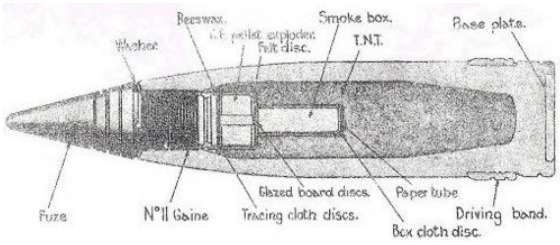
Flam C-250 Oil Bomb

Bomb Weight	480-520kg (1,058-1,146lb)
Explosive Weight	250-260kg (551-573lb)
Fuze Type	Electrical impact/mechanical time delay fuze
Bomb Dimensions	1957 x 640mm (77 x 25.2in)
Body Diameter	470mm (18.5in)
Use	Against fixed airfield installations, hangars, assembly halls, flyovers, underpasses, high-rise buildings and below-ground installations.
Remarks	40/60 or 50/50 Amatol TNT, Trialene. Bombs recovered with Trialen filling have cylindrical paper-wrapped pellets, 1-15/16in. in length and diameter.



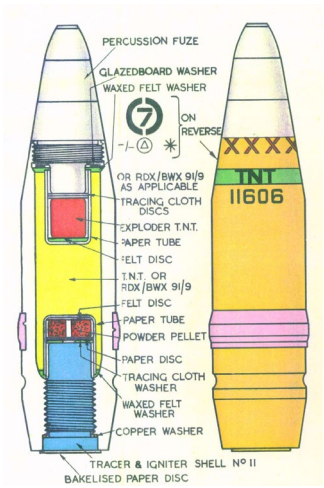
3.7 Inch QF Anti-Aircraft Projectile

Projectile Weight	28lb (12.6 kg)
Explosive Weight	2.52lbs
Fuze Type	Mechanical Time Fuze
Dimensions	3.7in x 14.7in (94mm x 360mm)
Rate of Fire	10 to 20 rounds per minute
Use	The 3.7in AA Mks 1-3 were the standard Heavy Anti-Aircraft guns of the British Army and were commonly used on the Home Front.
Ceiling	30,000ft to 59,000ft



40mm Bofors Projectile

Projectile Weight	1.96lb (0.86kg)
Explosive Weight	300g (0.6lb)
Fuze Type	Impact Fuze
Rate of Fire	120 rounds per minute
Projectile Dimensions	40 x 180mm
Ceiling	23,000ft (7000m)
Remarks	Light quick fire high explosive anti-aircraft projectile. Each projectile fitted with small tracer element. If no target hit, shell would explode when tracer burnt out. Designed to engage aircraft flying below 2,000ft.



3in Unrotated Projectile (UP) Anti-Aircraft Rocket ("Z" Battery)

HE Projectile Weight	3.4kg (7.6lb)
Explosive Weight	0.96kg (2.13lb)
Filling	High Explosive – TNT. Fitted with aerial burst fuzing
Dimensions of projectile	236 x 83mm (9.29 x 3.25in)
Remarks	As a short range rocket-firing anti-aircraft weapon developed for the Royal Navy. It was used extensively by British ships during the early days of World War II. The UP was also used in ground-based single and 128-round launchers known as Z Batteries. Shell consists of a steel cylinder reduced in diameter at the base and threaded externally to screw into the shell ring of the rocket motor.

B.2 Concept 2024 Additional GI factual report

CONCEPT
A PHENNA GROUP COMPANY
SITE INVESTIGATIONS

06/02/2025

Dear Sirs,

Re: 24/3980 Thorney Lane Phase 1 Due Diligence

This letter/report is in addition to the factual report with reference 24/3980-GIR-FR01 Issue 02, dated 16/12/2024 and summarises all additional postfield works and sampling works carried out at:

Site Location:	Thorney Business Park Thorney Lane Iver, SL0 9HE
Client:	ARUP
Additional Postfield Works:	29/10/2024-13/11/2024

1. Permeability Tests

12 No. Falling Head Tests and 15 No. Rising Head Test were carried out in all the boreholes in the installations in accordance with BS 5930:2015+A1:2020 as follows:

Table 1 – Permeability Testing Schedule

Hole ID	Measured base of the RZ (m bgl)	Response Zone		Type of Test	Date
		Top (m bgl)	Bottom (m bgl)		
DS24-03	3.00	1.00	3.00	RHT	29/10/2024
DS24-03	3.00	1.00	3.00	FHT	29/10/2024
DS24-07	1.64	0.75	1.60	RHT	30/10/2024

Hole ID	Measured base of the RZ (m bgl)	Response Zone		Type of Test	Date
		Top (m bgl)	Bottom (m bgl)		
DS24-07	1.64	0.75	1.60	FHT	30/10/2024
BH24-10	3.90	1.00	4.00	RHT (X3)	30/10/2024
BH24-10	3.90	1.00	4.00	FHT (X2)	30/10/2024
DS24-04	2.96	1.00	3.00	RHT (X3)	31/10/2024
DS24-04	2.96	1.00	3.00	FHT (X1)	31/10/2024
BH24-09	3.00	1.00	3.00	RHT	31/10/2024
BH24-09	3.00	1.00	3.00	FHT	31/10/2024
DS24-03	3.00	1.00	3.00	RHT (X3)	11/11/2024
DS24-03	3.00	1.00	3.00	FHT (X3)	11/11/2024
BH24-10	3.90	1.00	4.00	RHT (X3)	12/11/2024
BH24-10	3.90	1.00	4.00	FHT (X3)	12/11/2024

The results of the tests are presented in Section 4.

2. Water Sampling

Additional water sampling was carried out during 6 No. rounds between the 29/10/2024 and 13/11/2024 as follows:

Round 1- 29/10/2024 to 31/10/2024:

29/10/2024: BH24-10, DS24-07 & DS24-08.

Duplicate sample taken from DS24-07 named DS24-012

Field Blank sample taken named DS24-013

30/10/2024: BH24-02 (dipped but couldn't be sampled as it was a 19mm piezo not 50mm pipe, BH24-07, DS24-01, DS24-04, DS112 & CP105

31/10/2024: BH24-09, DS24-03 & DS24-05 & 3 No. Canal Samples

Round 2- 11/11/2024 to 13/11/2024:

11/11/2024: BH24-07, BH24-09, DS24-01, DS24-04 & CP105

12/11/2024: BH24-10, DS24-05, DS24-07 & DS24-08

Duplicate sample taken from DS24-07 named DS24-014

Field Blank sample taken named DS24-015

13/11/2024: DS24-03, DS112 & 3 No. Canal Samples

The samples were retrieved using a peristaltic pump at a low pumping rate. The pump tubing was lowered to target the standpipe response zone and a dipmeter was used during purging to ensure that the pumping rate did not reduce the water level. Generally, the water level remained steady at pumping rates of 2 litres every 4 minutes. Water parameters (pH, conductivity, dissolved oxygen, temperature and Redox levels) were recorded during purging using a flow cell and a YSI Professional Probe and purging was considered complete when parameters stabilised based on 3 consecutive results. Generally the water was noted as clear and the purging complete after between 6 and 10 litres was removed. On completion of purging, the water samples were collected in seven containers, 1 x ALE 503 – 330ml Plastic Bottle, 1 x ALE 219 – 250ml Glass, 2 x ALE 204 – HNO3 – Filtered & Unfiltered and 3 x PFAS Digi Tubes). They were then transferred to Concept laboratory inside cool boxes protected by bubble wrap and kept in the fridge until collection from the chemical laboratory was arranged. Each borehole was purged and sampled using a new length of tubing.

Canal sampling was completed with a bailer.

PFAS control measures were followed in accordance with LHR042 Thorney Ln_additional PFAS monitoring spec_1.0 (003)

The water quality field records are presented in Section 5.

3. Laboratory Testing

All chemical testing was specified and scheduled by Arup and carried out by ALS in accordance with the requirements of UKAS ISO17025 and MCERTS.

Sample for borehole DS24-01 collected on the 30/10/2024 was unsuitable for the PFAS full suite. A detailed section on deviations can be found in the first page of the results presented in tabular format in Section 6 of this report.

Yours sincerely,

For Concept

Dear Concept,

Re. Deviations on the Thorney Lane Project

Please note that some samples on this project have deviated and been analysed outside of the recommended holding times. Unfortunately due to instrument and capacity issues, the lab were not able to extract the samples within the holding times and in some cases, the samples required repeat analysis. The samples affected have been outlined below.

4 of the PFAS components as below have a shorter 7 Day holding time while all other PFAS is 28 days.

- MeFOSAA
- EtFOSAA
- MeFOSE
- EtFOSE

SDG 241031-53 - DS24-12
Sample required repeat analysis and was re-extracted after the 7 day holding times, the above 4 PFAS components were done outside of holding times and deviated. All other PFAS components were within holding times.

SDG 241102-50 – DS24-03
Sample required repeat analysis and was re-extracted after the 7 day holding times, the above 4 PFAS components were done outside of holding times and deviated. All other PFAS components were within holding times.

SDG 241112-28 - BH24-07, BH24-09, CP105, DS24-01 & DS24-04
Due to capacity and instrument issues, the samples were not extracted within the 7 day holding times and the above 4 PFAS Components were done outside of holding times and deviated. All other PFAS components were within holding times.

CERTIFICATE OF ANALYSIS

Date of report Generation:	25 November 2024
Customer:	Concept Engineering Consultants Ltd
Sample Delivery Group (SDG):	241031-53
Your Reference:	24/3980
Location:	Thorney Lane
Report No:	748022
Order Number:	103973 (CL6431)

This report has been revised and directly supersedes 746692 in its entirety.

We received 5 samples on Thursday October 31, 2024 and 5 of these samples were scheduled for analysis which was completed on Thursday November 14, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.

Approved By:

Lauren Ellis
General Manager Western Europe Environmental

Appendix General

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

CERTIFICATE OF ANALYSIS

Date of report Generation:	07 November 2024
Customer:	Concept Engineering Consultants Ltd
Sample Delivery Group (SDG):	241101-44
Your Reference:	24/3980
Location:	Thorney Lane
Report No:	746115
Order Number:	103980 (CL6437)

This report has been revised and directly supersedes 745877 in its entirety.

We received 5 samples on Friday November 01, 2024 and 5 of these samples were scheduled for analysis which was completed on Thursday November 07, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.

Appendix General

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

CERTIFICATE OF ANALYSIS

Date of report Generation:	15 November 2024
Customer:	Concept Engineering Consultants Ltd
Sample Delivery Group (SDG):	241102-50
Your Reference:	24/3980
Location:	Thorney Lane
Report No:	746752
Order Number:	103992 (CL6441)

This report has been revised and directly supersedes 746693 in its entirety.

We received 6 samples on Saturday November 02, 2024 and 6 of these samples were scheduled for analysis which was completed on Thursday November 14, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.

Appendix General

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

CERTIFICATE OF ANALYSIS

Date of report Generation:	02 December 2024
Customer:	Concept Engineering Consultants Ltd
Sample Delivery Group (SDG):	241112-28
Your Reference:	24/3980
Location:	Thorney Lane
Report No:	748773
Order Number:	104058 (CL6462)

This report has been revised and directly supersedes 748179 in its entirety.

We received 5 samples on Tuesday November 12, 2024 and 5 of these samples were scheduled for analysis which was completed on Monday December 02, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.

Approved By:

Lauren Ellis

Appendix General

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

CERTIFICATE OF ANALYSIS

Date of report Generation:	10 December 2024
Customer:	Concept Engineering Consultants Ltd
Sample Delivery Group (SDG):	241113-93
Your Reference:	24/3980
Location:	Thorney Lane
Report No:	749722
Order Number:	104063 (CL6465)

This report has been revised and directly supersedes 749362 in its entirety.

We received 6 samples on Wednesday November 13, 2024 and 6 of these samples were scheduled for analysis which was completed on Tuesday December 10, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.

Appendix

General

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

CERTIFICATE OF ANALYSIS

Date of report Generation:	02 December 2024
Customer:	Concept Engineering Consultants Ltd
Sample Delivery Group (SDG):	241114-80
Your Reference:	24/3980
Location:	Thorney Lane
Report No:	748774
Order Number:	104088 (CL6472)

This report has been revised and directly supersedes 748181 in its entirety.

We received 5 samples on Thursday November 14, 2024 and 5 of these samples were scheduled for analysis which was completed on Monday December 02, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.
Incorrect sampling dates and/or sample information will affect the validity of results.

Appendix

General

1. Results are expressed on a dry weight basis (dried at 35ºC) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH4 by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as “mixed hydrocarbons”. Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

19. **Sample Deviations**

If a sample is classed as deviated then the associated results may be compromised.

1	**Container with Headspace provided for volatiles analysis**
2	**Incorrect container received**
3	**Deviation from method**
4	**Matrix interference**
♦	**Sample holding time exceeded in laboratory**
@	**Sample holding time exceeded due to late arrival of instructions or samples**
§	**Sampled on date not provided**

20. **Asbestos**

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as “Not detected”. If no asbestos fibre types are found all will be reported as “Not detected” and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials andd soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

Asbestos Type	Common Name
Chrysotile	White Asbestos
Amosite	Brown Asbestos
Crocidolite	Blue Asbestos
Fibrous Actinolite	-
Fibrous Anthophyllite	-
Fibrous Tremolite	-

Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.

The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.

1. INTRODUCTION

Arup contracted Concept Engineering Consultants (Concept) to conduct a geoenvironmental investigation at Thorney Lane, located in the Thorney Business Park area, Iver SL0 9EE. The works were carried out in accordance with the Arup's Ground Investigation Specification document " *Thorney Lane DC1*", job number 276894-24, dated 04/02/2025, and Concept's Method Statement, reference 25/4047-RAMS-01, Rv01, dated 13/02/2025.

The geoenvironmental investigation was supplementary to the intrusive investigations required for the proposed development of a data centre with associated buildings and infrastructure at Thorney Lane.

The report has been prepared in accordance to the current Eurocode Standards, including the relevant National Annexes:

- BS EN 1997-1:2004+A1:2013 and National Annex NA to BS EN 1997-1:2004
- BS EN 1997-2:2007 and National Annex NA to BS EN 1997-2:2007

2. LIMITATIONS

This report contains factual information only and forms part of the Ground Investigation Report for the project as determined in BS EN 1997-2: 2007. Desktop studies, evaluation of geoenvironmental information and any interpretation of the data obtained other than the extrapolation of the test results where appropriate is beyond the scope of this report.

The data presented in this report reflects the ground conditions encountered at the locations of the investigation points at the time of the investigation. Ground conditions may vary away from the investigation locations and it is possible that ground conditions other than those indicated in this report may exist at the site. Test results of parameters sensitive to seasonal variations such as groundwater may also differ if carried out at a different time.

This report has been prepared for Arup and is based on their specific requirements and instructions and reasonable skill and care have been exercised in its preparation in accordance with the technical requirements of the brief. Any other party using the information in this report for any other purpose does so at their own risk and any duty of care to that party is excluded unless as determined in the contract documents of this project.

3. PROJECT PARTICULARS

Site Location:	Thorney Business Park Thorney Lane Iver, SL0 9HE
Client:	Arup
Investigation Supervisor:	Arup
Fieldwork:	18/02/2025 – 28/02/2025
Laboratory Work:	08/04/2025 – 16/05/2025
Postfield Works:	04/03/2025 – 08/04/2025

4. SITE DESCRIPTION

The site was bounded by the Slough Arm of the Grand Union Canal to the north, Great Western mainline to the south, additional mixed use industrial units to the east and fields to the west. The topography of the site was largely flat, sloping gently towards south of site.

The approximate centre of the site was located at National Reference: 502950E, 180050N.

Figure 1.1 Site Location Plan Not to Scale / Map data ©2025 Google

5. PURPOSE AND SCOPE OF WORKS

The purpose of the investigation was to understand the ground and groundwater conditions at the site and to determine the nature and extent of any ground and groundwater contamination.

The site was a mixed use commercial/industrial park comprising multiple business units, warehouses, hardstanding carparking, yard areas and storage spaces. It was formerly used for gravel pits, subsequently developed with concrete works (later demolished), warehouses and light industrial work.

The proposed works involved a Data Centre, comprising data storage warehouses, security facilities, access roads, parking, substation and associated infrastructure.

The scope of the works comprised the following:

- 5 No. Cable Percussion Boreholes to a depth of 10.00m;
- 18 No. Dynamic Sampling Boreholes to a maximum depth of 5.00m;
- Logging and Photographing;
- Instrumentation Monitoring and Sampling;
- Chemical Testing.

Key

CP – Cable Percussion Borehole
DS – Dynamic Sampling Borehole

6. INVESTIGATION METHODS

6.1 Utilities Survey and Inspection Pits

The detection of underground services followed the guidelines of PAS128:2022. Prior to boring commencing all exploratory hole locations were checked for utilities / buried services using a CAT and genny, existing utility information and hand dug inspection pits to an appropriate depth as identified by the services plans typically to a depth of 1.20m.

Surface concrete and asphalt where encountered, were diamond cored.

6.2 Cable Percussion Drilling

5 No. Cable Percussion Boreholes (BH25-01 to BH25-05) were drilled to a depth of 10.00m using a standard cable percussion rig (Dando 2000) with 150mm diameter casing as appropriate.

6.2.1 Sampling and Testing during Cable Percussion Drilling

Environmental samples (tubs, jars and vials) were taken for chemical analysis in the Made Ground or at each change of strata and where visual or olfactory evidence of contamination was noted or as instructed by the Investigation Supervisor. Following the guidance in the ICE Specification for Ground Investigation 3rd Edition - Headspace readings for volatile organic compounds (VOC) content were taken in all of the samples using a Phocheck Tiger photoionization detector (PID) with a 10.6 eV Krypton PID lamp. In accordance with the manufacturers guidelines, the PID was tested with a source of vapours at the start of each shift to ensure that it was not blocked and that the instrument calibration was within acceptable limits.

The borehole logs are presented in Section 11 of this report.

6.3 Dynamic Sampling Boreholes

18 No. Dynamic Sampling Boreholes (DS25-01 to DS25-18) were carried out to a maximum depth of 5.00m. The boreholes were drilled using a tracked Geo drive-tube sampling rig (Terrier) with 110mm diameter casing and a variety of liner sizes for sample retrieval.

DS25-03 was aborted at 3.00m depth due sand blowing in the casing. DS25-07 was also aborted at 3.00m depth as it was impossible to advance casing further than 1.50m, and borehole collapsed at 2.00m depth.

DS25-10 aborted at 2.00m due to presence of possible concrete slab at 2.00m. On DS25-11 location bouncing occurred and borehole aborted.

DS25-15 original location aborted at 0.53m depth due to two concrete obstructions encountered at 0.38m and 0.53m depth. Borehole moved to position DS25-15A.

Semi-rigid plastic core liners were recovered from each borehole location. The excavated soil was logged in accordance with BS5930:2015+A1:2020 and photographed.

Environmental samples (tubs, jars and vials) were taken for chemical analysis as described in Section 6.2.1

The borehole logs are presented in Section 12 and the core photographs are available in Section 15 of this report.

6.4 Standpipe Installations and Backfill

Monitoring wells were installed in the boreholes as follows:

Table 3 – Monitoring Installation Details

Hole ID	Base of Borehole (m bgl)	Diameter of Installation (mm)	Type of Installation	Base of Installation (m bgl)	Response Zone	
					Top (m bgl)	Bottom (m bgl)
BH25-01	10.00	50	GMP	1.00	0.70	1.00

KEY
GMP – Gas Monitoring Point
GWMP – Groundwater Monitoring Point

The boreholes were backfilled at the base with hydrated bentonite pellets with the gas/groundwater response zones backfilled with a 10mm pea shingle filter with a geosock surround. All installations were finished with hydrated bentonite pellets to the surface with concrete and a lockable stopcock cover flush with the ground.

The boreholes with no installations were backfilled with bentonite pellets.

On completion of works the ground surface at all fieldwork locations was permanently reinstated to its original condition as appropriate.

6.5 Instrumentation Monitoring and Sampling

Gas and groundwater monitoring was carried out by Concept subsequent to completion of the boreholes on 3 No. scheduled visits completed in 3 days due to the large number of locations, between the 24/03/2025 and 08/04/2025. Historic boreholes BH24-03, BH24-05, BH24-06, BH24-07, BH24-08, BH24-09, BH24-10, DS24-02, DS24-07, DS24-08 and CP105 were also monitored. Water, sediment and gas sampling was also carried out.

Boreholes were developed on two occasions between the 04/03/2025 and the 18/03/2025 to comply with the Investigation Supervisor's requirements and specifications. Development was carried out prior to water sampling using a Wasp pump which provides a relatively high pumping rate to remove water and entrained sediment. Development continued until either the well ran dry, the water ran clear or at least 3 well volumes were removed.

- **Development** of the boreholes carried out as follows:

04/03/2025 to 05/03/2025: All boreholes.

17/03/2025 to 18/03/2025: All boreholes and historic CP105 were redeveloped. Water quality in situ analysis was also carried out upon the investigation supervisor's request.

- **Water sampling** carried out from current and historic boreholes and from locations Canal 1, Canal 2, Canal 3, Canal 4, Drainage 1A, Drainage 2A and Attenuation Pond as follows:

Round 1 03/03/2025: Canal 1, Canal 2, Canal 3, Canal 4, Drainage 1A, Drainage 2A & Attenuation Pond

Round 2 24/03/2025: BH25-03, BH25-05, DS25-04, DS25-07, DS25-08, DS25-09 & DS25-10

25/03/2025: BH25-02, BH25-04, BH25-10-*(Duplicate BH25-02)*, BH25-11-*Field Blank*, DS25-02, DS25-05, DS25-06 & CP105

26/03/2025: BH24-05, BH24-06, BH24-07, BH24-10, DS24-04, DS24-08 & DS25-03

Round 3 31/03/2025: BH25-05, DS25-06, DS25-08, DS25-09 & repeat samples from Canal 3 and Attenuation Pond from Round 1

01/04/2025: BH25-03, BH25-04, DS25-02, DS25-03, DS25-04, DS25-05, DS25-07, DS25-10, DS25-11-*(Duplicate DS25-10),* Canal 3, Canal 2, repeat sample from Drainage 1A, Drainage 2A

02/04/2025: Canal 1, Canal 4, Drainage 1A & Attenuation Pond

Round 4 07/04/2025: BH25-03, BH25-05, DS25-07, DS25-08, DS25-09, DS25-10, DS25-15-*Field Blank* & DS25-16-*(Duplicate DS25-09)*

08/04/2025: BH25-04, DS25-02, DS25-03, DS25-04, DS25-05 & DS25-06

The samples were retrieved using a peristaltic pump at a low pumping rate. The pump tubing was lowered to target the standpipe response zone and a dipmeter was used during purging to ensure that the pumping rate did not reduce the water level. Generally, the water level remained steady at pumping rates of 1 litre every 2 minutes. Water parameters (pH, conductivity, dissolved oxygen, temperature and Redox levels) were recorded during purging using a flow cell and a YSI Professional Probe. Purging was considered complete when parameters stabilised . Stabilisation was defined as where 3 subsequent readings were recorded within the range given in the Arup Specification (DO 10%, temperature 3%, pH 1 unit, redox 10 mV, SPC 3%). Generally, the water was noted as running clear on the completion of purging. On completion of purging, the water samples were collected in containers (3x300ml and 3xvial). They were then transferred to Concept laboratory inside cool boxes protected by bubble wrap and kept in the fridge until collection from the chemical laboratory was arranged. Each borehole was purged and sampled using a new length of tubing.

The water quality field records are presented in Section 13.

- **Sediment sampling** carried out from Drainage 1, Drainage 2, Drainage 3 and Attenuation Pond locations as follows:

Round 1 25/03/2025: Drainage 2 & Drainage 3

Round 2 01/04/2025: Drainage 1 & Drainage 2

02/04/2025: Drainage 3 & Attenuation Pond

Round 3 08/04/2025: Drainage 1 & Attenuation Pond

- **Gas monitoring** carried out during 3 No. rounds as follows:

Round 1 24/03/2025-26/03/2025 : BH24-03, BH25-01, BH25-02, BH25-03 BH25-04, BH25-05, DS24-02, DS25-01 & DS25-06

Round 2 31/03/2025-01/04/2025: BH24-03, BH25-01, BH25-02, BH25-03 BH25-04, BH25-05, DS24-02, DS25-01 & DS25-06

Round 3 08/04/2025: BH24-03, BH25-01, BH25-02, BH25-03 BH25-04, BH25-05, DS24-02, DS25-01 & DS25-06

- **Gas samples** carried out as follows:

Round 1 07/04/2025: BH24-03, BH25-03 & DS24-02

Gas samples were collected using Tedlar bags.

A Geosense dipmeter was used for water monitoring. An In-Situ Rugged interface probe was used to prove/disprove the presence LNAPL and DNAPL during the 3rd round of monitoring. The single valve gas concentrations were recorded using Gas data GFM436 monitors. Where 0.00 is shown on the results indicates value lower than the detection limit of the machine. PID readings were taken during all monitoring rounds. The accuracy of the instruments is summarised in Section 13 where the gas monitoring reports and groundwater results are presented along with the instruments calibration sheets.

PFAS control measures were followed.

6.6 Logging / Laboratory Testing

Logging of all soil samples was carried out in accordance with BS5930:2015+A1:2020.

Chemical testing was specified and scheduled by Arup and carried out by Eurofins. Water sampling testing was carried out by ALS and Socotec carried out the gas sampling testing. All were in accordance with the requirements of UKAS ISO17025 and MCERTS. The results are presented in tabular format in Section 14 of this report.

6.7 Setting Out

The locations of all exploratory holes were agreed with the Investigation Supervisor and set out prior to commencement of the site works.

Following completion of the ground works the locations and elevations of the boreholes were established by Concept using GPS equipment relevant to UK National Grid and Newlyn datum. The GPS equipment used for the survey was a Leica GS07 model. The data sheet and certificate of conformity is appended in Section 10 of this report along with the Exploratory Hole Location Plan presenting the co-ordinates and levels of all as-built locations.

7. RISK REGISTER

This entire report forms part of the Health and Safety File of the project. The table below highlights particular risks only and is not inclusive of every risk that is encountered on site. The various sections of this report describe the site and ground conditions encountered during the investigation works whilst laboratory testing determines the level of contamination encountered during the works.

Underground services where encountered were identified on the exploratory hole logs and where necessary, the holes were repositioned locally to avoid identified services. The presentation of services information is beyond the scope of this report.

Table 4 – Risk Register

HAZARD	DESCRIPTION	MITIGATION
Contamination Pathways associated with Monitoring installations	Monitoring installations were constructed at several locations as detailed in Section 6.3 of this report.	Decommissioning of the installations which will involve either filling the pipe with cement-bentonite grout where possible or by drilling out the pipework and then backfilling using cement- bentonite grout.

8. GEOLOGICAL GROUND PROFILE

The geological strata encountered during the investigation are summarised in the table below. The Top and Bottom of the strata noted in the table indicates the highest and lowest boundaries encountered in all exploratory holes.

Table 5 - Geological Ground Profile

STRATUM	TOP (mOD)	BASE (mOD)	DESCRIPTION	
CONCRETE *(All Locations, except DS25-02)*	+32.71 to +30.78	+32.41 to +30.48	Grey CONCRETE with flint gravel clasts and generally rare air voids; DS25-06 encountered Concrete at the following elevations, between Made Ground: • +30.22 to +30.12 mOD	
MADE GROUND *(All Locations)*	+32.41 to +30.48	+31.79 to +28.15	Top: +31.42 - +29.10 Base: +30.39 - +28.15	Soft to firm, brown mottled greyish brown locally dark grey mottled grey slightly gravelly slightly sandy CLAY with occasional pockets of fine sand, and occasional wood fragments Gravel comprises angular to subrounded fine to coarse flint, brick, concrete and clinker-like fragments. Slight hydrocarbon odour encountered in BH25-04, BH25-05, DS25-02, DS25-10 & DS25-13.

STRATUM	TOP (mOD)	BASE (mOD)	DESCRIPTION	
			Top: +31.59 - +29.81 Base: +31.12 - +28.22	Brown locally dark grey and orangish brown gravelly slightly clayey fine to coarse SAND. Gravel comprises angular to subrounded fine to coarse flint, quartz, brick, concrete and clinker-like fragments. Slight hydrocarbon odour encountered in BH25-02, DS25-02, DS25-08 & DS25-10.
			Top: +32.41 - +29.98 Base: +31.79 - +29.17	Brown locally dark brown sandy GRAVEL locally with low concrete cobble content and occasional wood fragments. Gravel comprises angular to subrounded fine to coarse flint, quartz brick, concrete and clinker-like fragments. Slight to strong hydrocarbon odour encountered in DS25-01, DS25-11, DS25-13, DS25-15A & DS25-17
LYNCH HILL GRAVEL MEMBER *(All Locations, except DS25-01, DS25-04, DS25-10, DS25-11)*	+31.79 to +28.15	+30.51 to +26.31	Brown gravelly fine to coarse SAND. Gravel is angular to subrounded fine to coarse flint. Slight hydrocarbon odour encountered in DS25-15A Brown and orangish brown sandy angular to subrounded fine to coarse flint GRAVEL.	
WEATHERED LONDON CLAY *(All Locations, except DS25-10, DS25-11)*	+30.51 to +26.31	Extent not proven	Firm locally firm to stiff, brown locally orangish brown and dark grey slightly sandy micaceous locally slightly gravelly silty CLAY with occasional pockets of brown and grey fine sand. Gravel is angular to subrounded medium to coarse flint. Sand is fine.

Client

Arup

Sheet 1 of 1

Well	PROGRESS Date	Casing	Water	Water Strikes	Level (mOD)	Legend	Depth (m)	Stratum Description	SAMPLES & TESTS Depth (m)	Type	Results
	20/02/25		Dry					Concrete			
					30.69		0.23	Greyish brown very gravelly fine to coarse SAND with low concrete cobble content and rare ceramic, plastic and wood fragments (<60mm). Gravel comprises angular to rounded fine to coarse flint, brick, concrete, asphalt, clinker-like and slag-like fragments. (MADE GROUND)	0.30 0.30	ES1 PID	0.00 ppm
					30.12		0.80	Greyish brown very sandy GRAVEL with rare metal (<100mm) and wood (<50mm) fragments and slight hydrocarbon odour. Gravel comprises angular to rounded fine to coarse flint, quartz, brick and clinker-like fragments. Sand is fine to coarse. (MADE GROUND)	1.00 1.00	ES2 PID	0.10 ppm
	20/02/25 25/02/25		1.20 Dry		29.72		1.20	Dark brown sandy GRAVEL with wood fragments (<60mm) and slight hydrocarbon odour. Gravel comprises angular to rounded fine to coarse flint, quartz, brick and clinker-like fragments. Sand is fine to coarse. (MADE GROUND)	1.50 1.50	ES3 PID	4.70 ppm
	25/02/25	1.60	Dry		29.32		1.60	End of hole at 1.60m			... Borehole aborted at 1.60m depth (see Remarks)

Dynamic Sampling Information

From (m)	To (m)	Diameter (mm)	Recovery (%)	Method / Plant Used
1.20	1.60	87	40	Hilti DD350 Hand Excavated Terier 1

General Remarks

1. Surface concrete was diamond cored and an inspection pit was hand excavated to 1.20m depth prior to borehole boring commencing.
2. Water seepage with oily sheen encountered at 1.20m rising to 1.06m.
3. 110mm diam casing used from ground level to 1.60m depth.
4. Borehole aborted at 1.60m depth due to refusal.
5. Borehole backfilled with bentonite pellets and made good on completion.

3.00	4.00	77	90	Terier 1

General Remarks

1. Surface concrete was diamond cored and an inspection pit was hand excavated to 1.20m depth prior to borehole boring commencing.
2. 110mm diam casing used from ground level to 2.00m depth.
3. Borehole backfilled with bentonite pellets and made good upon completion.

AGS

ABBREVIATIONS KEY Samples: ES – Environmental (Tab, Jar, Vial), U(76) – 76mm Undisturbed, L- Liner, D – Disturbed, B - Bulk, LB – Large Bulk, BLK – Block Sample, W – Water, R-Root
Tests: SPT – Standard Penetration Test, HV – Shear Hand Vane, PP – Pocket Penetrometer, PID – Volatile Organic Compounds, AZCL – Assumed Zone of Core Loss

Sheet 1 of 1

Well	PROGRESS Date	Casing	Water	Water Strikes	Level (mOD)	Legend	Depth (m)	Stratum Description	SAMPLES & TESTS Depth (m)	Type	Results
	21/02/25		Dry					Grey CONCRETE, clasts are angular to rounded fine to coarse flint gravel (max spacing between aggregate <5mm). Rare air voids.			
					31.13		0.28				
								Brown gravelly fine to coarse SAND with occasional wood fragments (<60mm). Gravel comprises angular to subrounded fine to coarse flint and brick fragments. (MADE GROUND)	0.40 0.40	ES1 PID	 0.10 ppm
					30.91		0.50				
								Brown very sandy GRAVEL with wood fragments (<60mm). Gravel comprises angular to rounded fine to coarse flint, quartz, brick and clinker-like fragments. Sand is fine to coarse. (MADE GROUND)	0.90 0.90	ES2 PID	 0.10 ppm
	21/02/25 24/02/25		Dry 0.60		30.21		1.20	Soft, brownish grey slightly sandy gravelly CLAY with 1No root (<100mm). Gravel is angular to subrounded fine to coarse flint. Sand is fine. (MADE GROUND)	1.20 1.20	ES3 PID	 1.10 ppm
					29.91		1.50	Soft to firm, greyish brown mottled brown slightly sandy slightly gravelly CLAY. Gravel is subangular to subrounded fine to coarse flint. Sand is fine. (MADE GROUND)			
	24/02/25	2.00	Dry						2.00 2.00	ES4 PID	 0.00 ppm
					28.56		2.85	Brown sandy slightly clayey angular to subrounded fine to coarse flint GRAVEL. Sand is fine to medium. (LYNCH HILL GRAVEL MEMBER)	2.90 2.90	ES5 PID	 0.10 ppm
					28.26		3.15	... sand becoming fine to coarse below 3.00m			
								Firm, brown slightly sandy micaceous CLAY. Sand is fine. (THAMES GROUP: WEATHERED LONDON CLAY)			
					27.89		3.52	... with reddish brown very weak sandstone at 3.48m			
								Firm to stiff grey CLAY with occasional pockets of light grey sand (<70mm). (THAMES GROUP: WEATHERED LONDON CLAY)			
								... with a pocket of pyrite nodules (<20mm) at 4.00m ... AZCL between 4.00m and 4.40m			
								... becoming very closely to closely fissured below 4.40m. Fissures are randomly orientated, planar, unpolished			
	24/02/25	2.00	Dry		26.41		5.00	End of hole at 5.00m			

Dynamic Sampling Information

From (m)	To (m)	Diameter (mm)	Recovery (%)	Method / Plant Used
1.20	2.00	87	80	Hilti DD350
2.00	3.00	87	100	Hand Excavated
3.00	4.00	77	100	Terier 1
4.00	5.00	47	60	

General Remarks

1. Surface concrete was diamond cored and an inspection pit was hand excavated to 1.20m depth prior to borehole boring commencing.
2. Water present in the IP at 0.50m depth
3. 110mm diam casing used from ground level to 2.00m depth.
4. Borehole backfilled with bentonite pellets and made good upon completion.

SITE INVESTIGATIONS

GROUNDWATER - IN SITU ANALYSIS & SAMPLING

Site:	**LHR042 Thorney Lane DC1**
Job No.:	**25/4047**
Date:	**24/03/2025**
Technician:	**IJ & AD**
Sampling method:	*Low Flow (peristaltic)*
Water Quality Meter No:	
Turbidity Meter No:	

BH No.	Base of well (mbgl)	Depth to GW Start (mbgl)	Depth to GW End (mbgl)	Weather / Temperature (°C) / Comments:
DS25-09	2.71	1.19	1.20	Cloudy, 8°C PFAS control measures were followed.
