Basis of Report

This document has been prepared by SLR Consulting Ltd (SLR) with reasonable skill, care and diligence, and taking account of the timescales and resources devoted to it by agreement with **Iron Mountain UK Data Centre Limited** (the Client) as part or all of the services it has been appointed by the Client to carry out. It is subject to the terms and conditions of that appointment.

SLR shall not be liable for the use of or reliance on any information, advice, recommendations and opinions in this document for any purpose by any person other than the Client. Reliance may be granted to a third party only in the event that SLR and the third party have executed a reliance agreement or collateral warranty.

Information reported herein may be based on the interpretation of public domain data collected by SLR, and/or information supplied by the Client and/or its other advisors and associates. These data have been accepted in good faith as being accurate and valid.

The copyright and intellectual property in all drawings, reports, specifications, bills of quantities, calculations and other information set out in this report remain vested in SLR unless the terms of appointment state otherwise.

This document may contain information of a specialised and/or highly technical nature and the Client is advised to seek clarification on any elements which may be unclear to it.

Information, advice, recommendations and opinions in this document should only be relied upon in the context of the whole document and any documents referenced explicitly herein and should then only be used within the context of the appointment.

1.0 Introduction

SLR Consulting Limited (SLR) has been commissioned Iron Mountain UK Data Centre Limited (IM) to prepare a Site Condition and Baseline Report in support of an Environmental Permit (EP) application for their Iron Mountain Data Centre LON-1, located on 724-729 Dundee Road, Slough, SL1 4JU (hereafter referred to as 'the Site').

This report combines both the requirements of a Site Condition Report and Baseline Report into a single document.

The following sections of this report introduce the Site, the assessment works undertaken and reporting of the baseline soil and groundwater conditions at the Site.

1.1 Scope of Work and Study Limitations

This Site Condition Report (SCR) aims to record and describe the condition of the land prior to the commencement of any operations within the proposed EP installation boundary. It has been prepared in accordance with the Environment Agency's (EA) Site Condition Report H5 guidance with regards to the requirements of a baseline report to meet the requirements of Article 22 (2) of Industrial Emissions Directive (IED).

This SCR will provide a point of reference and baseline environmental data so that when the EP is surrendered it can be demonstrated that there has been no deterioration in the condition of the land as a result of the Installation operations and ensure that the condition of the land is in a 'satisfactory state'.

Additionally, where an environmental permitted activity produces, uses or releases Relevant Hazardous Substances (RHS) (as detailed in Article 3(128) of the IED), a risk assessment is required in accordance with Article 22(2). This SCR also includes an assessment of potential risk from RHS.

The location of the site is illustrated in Drawing 410.066934.00001. The site layout; site boundary and proposed EP boundary and emission points are presented on Drawing DC-SLR-XX-XX-D-EM-000005

Sections 1 to 3 of the EA's SCR template[1] (have been completed within this document and comprise the following aspects:

- Site details (Chapter 2);
- Condition of the land at permit issue(Chapter 2);
- Geology (Chapter 2);
- Hydrology (Chapter 2);
- Hydrogeology (Chapter 2);
- Pollution history (Chapter 2);
- Evidence of historic contamination (Chapter 2); and
- Permitted activities (Chapter 3).

Sections 4 to 7 of the SCR template will be maintained during the life of the EP and Sections 8 to 10 will be completed and submitted in support of the application to surrender the EP.

[1] EA Environmental Permitting Site Condition Report Guidance https://www.gov.uk/gov7ernment/publications/environmental-permitting-h5-site-condition-report accessed June 2025.

1.2 Sources of Information

SLR has collected and reviewed various reports and drawings to characterise the Site and its surrounds. These sources are as follows:

- Multi Agency Geographical Information for the Countryside[2] (MAGIC) map
- British Geological Survey[3]
- EA. Flood map for planning[4]
- European Chemicals Agency[5]

The following reports were also reviewed and are referred to, and should be read in conjunction with this report:

- Envirocheck Report (enclosed within Appendix A to this report);
- Desk Study & Ground Investigation Report for Dundee Road, Slough, GEA October 2018. (Appendix B)

Information from the above sources is included within the following sections of this report.

[2] Multi-Agency Geographical Information for the Countryside Map, available at www.magic.defra.gov.uk, accessed in April 2026.

[3] British Geological Survey, available at http://www.bgs.ac.uk, accessed April 2026.

[4] Flood map for planning, available at https://flood-map-for-planning.service.gov.uk/, accessed April 2026.

[5] European Chemicals Agency, available at ECHA CHEM, accessed April 2026

2.0 Site Condition Report

The aim of this SCR is to describe and record the condition of the land and groundwater at the site at the point of applying for an environmental permit. This SCR will enable IM to demonstrate that they have protected the land and groundwater by updating the SCR during the lifetime of the permit as appropriate.

Sections 1 to 3 of this SCR have been completed using an Envirocheck Report as presented in Appendix A and the Desk Study & Ground Investigation Report for Dundee Road, Slough, prepared by GEA in October 2018, presented in Appendix B.

Throughout the lifetime of the site, records will need to be maintained for the purposes of completing Sections 4-7 of this SCR.

Upon cessation of the activities at the site, Sections 8-10 are to be completed to support an application to surrender the site's environmental permit.

2.1 Site Details

Name of the applicant	Iron Mountain UK Data Centre Limited
Activity address	724-729 Dundee Road, Slough, SL1 4JU
National grid reference	NGR SU 94926 81766
Document references for site plans (including location and boundaries)	Drawing 410.066934.00001 Site Location Plan,

2.2 Condition of the Land at Permit Issue

Environmental setting including: • geology • hydrogeology • surface waters	**Geology** The British Geological Survey (BGS) does not record Made Ground within the vicinity of the site, bit provides the following detail.. Superficial deposits beneath the site are recorded to comprise Langley silt (clay and silt). The underlying bedrock comprises a sedimentary combination of clay, silt, and sand of the Lambeth Group. **Hydrogeology** Magic.gov.uk accessed on 22.4.26 shows that the site bedrock is classified as a secondary A aquifer.and suggests locally the drift is unproductive, although GEA found the Langley silts to be classed as a secondary A aquifer. The site is located within a Zone 2 Source Protection Zone (SPZ).

	The GEA site investigation advanced three boreholes and encountered between 0.4 and 0.5m of made ground. There were fragments of brick and concrete but no visual or olfactory indication of contamination. Below this, silty clay and silty sandy gravelly clay were encountered to a depth of approximately 2 or 3 m. Below this, yellow brown mixed clays, silts, sands and gravels were encountered. GEA believed these to be part of the Taplow Gravel. Groundwater was identified in boreholes 1 and 3 at a depth of approximately 5m. Data from an Envirocheck suggests the site sits 136m away from a principal aquifer, which suggests a layer of rock that has high permeability and water storage capacity. This also is classified as an area of high groundwater vulnerability which is present in river terrace gravels with high pollutant speed. There is also potential for groundwater flooding of property situated below ground to the north and northwest of the site. This should not impact the site. **Hydrology** According to the EA's Flood Map for Planning the site is flood zone 1 and therefore at extremely low probability of flooding. According to MAGIC, the groundwater vulnerability at the site is classified as medium to low and soluble rock risk, therefore there is a medium risk of a pollutant reaching the groundwater below the site. A stream flows through the nature reserve approximately 440m to the west of the site and Magic suggests there is a pond approximately 450m from the site within the nature reserve. The Jubilee River, a tributary of the Thames, lies approximately 2.5km to the south. GEA concluded it was likely groundwater flow is in a southerly direction, towards the Thames.
Pollution history including: • pollution incidents that may have affected land • historical land-uses and associated contaminants • any visual/olfactory evidence of existing contamination • evidence of damage to pollution prevention measures	**Site Land Use** The GEA report found that the site itself was undeveloped until around 1981, when a large warehouse was constructed on site. Land to the south of the site had been developed for industrial use since the mid-1920s. The historical mapping provided with the Envirocheck suggests that between 1883 and 1975 the site was in agriculture use, labelled as Cockfield Farm. Between 1975 and 1987 a large warehouse or similar building is present on the site. In terms of adjacent landuse the Slough Trading Estate is shown to be developed from the 1920s with a

	number of factories shown to the south of the site from 1926. These include a ice factory, jam factory, cable works, leather and rubber works, motor works and chemical works. By 1938 the factories have changed, the jam factory has gone and a much larger motorworks is shown. From 1975 the factories and commercial buildings to the south look much as they do today. A pit is shown some distance north of the site between 1926 and 1975 (when it is marked as “disused pit”). This appears to have been filled during the 190s as it disappears from the plans in 1999. Housing starts to be developed to the northwest and northeast during the 1970s with the houses immediately north of the site first appearing on the 1987 plan when the site itself is first developed. There are various sensitive land uses surrounding the area. There are two Local Nature Reserves; Haymill Valley situated 429m to the west, and Cockershed Wood, 938m to the north of the site. There are also two Ancient Woodlands, 1,524m to the Northwest, and 1,453m to the north of the site. The site is also within an area of large industrial presence. There are 122 Commercial service within a 1km radius of the site, with the closest being Ontime Media Logistics Ltd, 37m to the southwest. There are 30 manufacturing and production sites, with Yeovil Enterprise Centre being the closest at 266m to the west of the site. There are also a few recreational and environmental land uses, such as the playground adjacent to the northern boundary pf the site. **Pollution History** <u>Pollution Incidents</u> There have been 14 pollution incidents to controlled waters, with the closest being 284m to the west on the Slough Industrial Estate. From this there are 2 events which are on the Substantiated Pollution Incident Register; a Category 1 Major incident to water 435m southwest of the site in 2009, and a Category 2 incident to water and land 606m to the southwest of the site in 2008.
Evidence of historic contamination, for example, historical site investigation, assessment, remediation and	GEA took 5 samples from the made ground horizon only. Of these, three were tested for a range of common contaminants. Testing revealed the soil to have a pH of between 9.1 and 10.7. Some low level

verification reports (where available)	metals were present as well as PAHs (up 16.4mg/kg Total PAH) and TPH (up to 1,700mg/kg). Speciation of the TPH showed aromatics and aliphatics were within their individual screening values. Cadmium, mercury, phenol and cyanide were all below the limits of detection. All measurements were within the soil guideline values for commercial use. Asbestos was detected in borehole 2 and was quantified at 0.028%. No methane was detected though depleted oxygen was encountered in the boreholes with very low levels of CO and VOCs being detected. Full results are in Appendix B.
Baseline soil and groundwater reference data	Refer to Appendix B.

2.1 Relevant Hazardous Substances

As the permitted activity is purely the combustion of diesel to generate electricity there are very few materials on site associated with the installation. These may include some maintenance oils but these will be in small quantities and where they are handled correctly, i.e. stored in appropriate containers with drip trays or similar and lids in place, they should not pose any significant risk.

The only relevant hazardous substance of concern on site is the diesel fuel. This is stored in the following:

3X 1,000l day tanks

6X 4,000l day tanks

3X 44,500l bulk tanks

2X 44,500 belly tanks

2x 80,000l bulk tanks and

1X 1,135l tank to power the sprinkler system pump.

Further detail is provided in Appendix C.

All tanks are properly maintained, have high level alarms and are stored within compliant bunding which is capable of holding 110% of the contents of the largest tank in the bund. All tanks have secondary containment and some also have tertiary containment. Pipework is above ground for ease of inspection and maintenance and is generally pipe in pipe to provide secondary containment. The tanks and bunds are inspected daily by site staff and undergo an annual third party inspection. Non the less, a major spillage of diesel would pose a risk to the environment.

Soil samples have been tested for petroleum hydrocarbons and PAHs which would be the likely indicators of diesel contamination. Background levels of TPH were measured at between 290mg/Kg and 1,700mg/Kg.

3.0 Permitted Activities

Permitted activities	The site is permittable under section 1.1A(1)(a) of Schedule 1 the Environmental Permitting Regulations 2016. That is, "Burning any fuel in an appliance with a rated thermal input of 50 or more megawatts" because the combined thermal input of the generators is greater than 50MW. There are 11 generators and 5 bulk storage tanks for diesel alongside smaller belly tanks and day tanks.
Non-permitted activities undertaken	There is a need for cooling of the data rooms. Fluorinated chemicals are use in the refrigerants for air conditioning and cooling systems. A register of F gases is maintained on site detailing which equipment contains these and a maintenance and leak detection programme is in place with records being kept.
Document references for: • plan showing activity layout; and	Drawing 2947-TPA-MF-00-DR-A-20000 (2) ground floor plan.

• environmental risk assessment.	Environmental Risk Assessments are included as part of the environmental permit application package SLR ref. 410.066934.00001

4.0 Changes to the activity

Have there been any changes to the activity boundary?	To be maintained during the lifetime of the site
Have there been any changes to the permitted activities?	To be maintained during the lifetime of the site
Have any 'dangerous substances' not identified in the Application Site Condition Report been used or produced as a result of the permitted activities?	To be maintained during the lifetime of the site
Checklist of supporting information	To be maintained during the lifetime of the site

5.0 Measures taken to protect the land

To be maintained during the lifetime of the site	
Checklist of supporting information	

6.0 Pollution Incidents and Remediation

To be maintained during the lifetime of the site	
Checklist of supporting information	

7.0 Soil Gas and Water Quality Monitoring

To be maintained during the lifetime of the site	
Checklist of supporting information	

8.0 Decommissioning and Removal of Pollution Risk

To completed upon surrender of the environmental permit	
Checklist of supporting information	

9.0 Reference Data and Remediation (where relevant)

To completed upon surrender of the environmental permit	
Checklist of supporting information	

10.0 Statement of Site Condition

To completed upon surrender of the environmental permit

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

LANDMARK INFORMATION GROUP®

Berkshire

Published 1881 - 1882

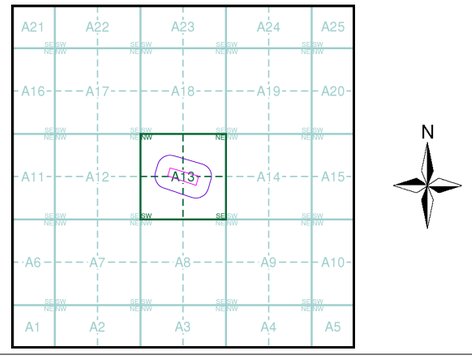

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Buckinghamshire

Published 1901

Source map scale - 1:10,560

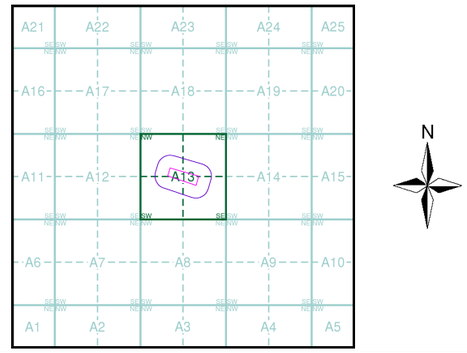

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

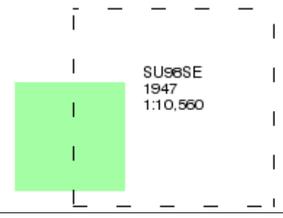

Published 1947

Source map scale - 1:10,560

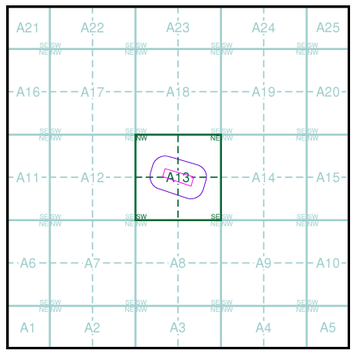

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

VectorMap Local

Published 2026

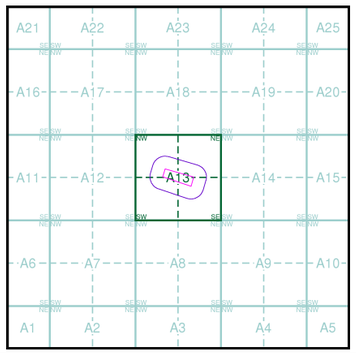

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

EXECUTIVE SUMMARY

This executive summary contains an overview of the key findings and conclusions. No reliance should be placed on any part of the executive summary until the whole of the report has been read. Other sections of the report may contain information that puts into context the findings that are summarised in the executive summary.

BRIEF

This report describes the findings of a site investigation carried out by Geotechnical and Environmental Associates Limited (GEA) on the instructions of Pinnacle Consulting Engineers Ltd, with respect to the construction of a new rear extension to the existing warehouse. The purpose of the investigation has been to research the history of the site with respect to possible contaminative uses, to determine the ground conditions , to assess the extent of any contamination and to provide information to assist with the design of hardstanding, soakaways and spread foundations for the proposed development.

SITE HISTORY

The earliest map studied, dated 1876, shows the site and surrounding area to be largely undeveloped, with only a small building, later marked as Cockfield Farm, directly to the south of the site and a footpath crossing the centre of the site in a north to south alignment. By 1924, the area approximately 80 m to the south of the site had been developed with a number of large industrial buildings, including an artesian ice factory and jam factory. Railway tracks are shown to run in a northwest to southeast alignment directly to the north of these buildings and oil tanks were present approximately 120 m to the southwest of the site. The 1932 map indicates that the jam factory had become a surgical dressing works, and a motor works was also present just southeast of the site. The 1955 map indicates that a foundry was located to the east of Cockfield Farm and the industrial area to the south of the site had a number of uses, including electrical and paint works, warehouses, depots and factories, all within 100 m of the site. Cooling towers and an electrical sub-station were present approximately 70 m and 90 m to the southeast of the site respectively. By 1962, Cockfield Farm and the foundry had been cleared and the cooling towers replaced by a factory. By 1981, a large warehouse is shown on site. Since 2006 and the present day, the warehouse is shown to have been extended further south.

GROUND CONDITIONS

Beneath a moderate thickness of made ground, Langley Silt was encountered over Taplow Gravel which was proved to the maximum depth investigated of 6.00 m (26.40 m OD). The made ground was found to extend to depths of between 0.40 m (32.00 m OD) and 0.52 m (31.74 m OD). The Langley Silt comprised an initial horizon of soft greyish black silty clay with carbonaceous material in Borehole Nos 1 and 2 only, to a maximum depth of 0.50 m (32.55 m OD). Beneath this layer, it generally comprised firm brown silty slightly sandy slightly gravelly clay with some decayed roots and carbonaceous material and extended to depths of between 2.10 (30.30 m OD) and 3.00 m (30.09 m OD). The Taplow Gravel initially comprised firm light yellowish brown firm sandy slightly gravelly clay, becoming dense light yellow clayey silty sand in Borehole Nos 1 and 3 only, to depths of 4.00 m (29.07 m OD) and 5.10 m (27.3 m OD). Below these depths, the stratum comprised dense light yellow and greyish brown clayey silty sand and gravel to the maximum depth investigated of 6.00 m (26.40 m OD). In Borehole No 2, the Taplow Gravel was encountered at depth of 3.00 m and comprised very dense light brown very sandy gravel to the full depth investigated, of 4.00 m.

Groundwater was encountered during drilling at a depth of approximately 5.00 m (28.09 m OD) and has subsequently been monitored at a shallowest depth of 4.93 m (28.12 m OD). No elevated concentrations of contaminants were detected within three samples of the made ground tested, although trace concentrations of asbestos at 0.028% were detected within a single sample taken from Borehole No 2.

RECOMMENDATIONS

Spread foundations may be designed to apply a net allowable bearing pressure of 100 kN/m^2 in the firm clay of the Langley Silt, increasing to 175 kN/m^2 in the clayey silty sand of the Taplow Gravel which was present below a depth of 2.00 m in Borehole Nos 1 and 3 only. The recommended bearing pressure takes account of the variable nature of the soils and any foundations should be nominally reinforced where they span clay and granular material to protect against differential settlement. Perched water or minor seepages may occur within the made ground and natural soils which can be dealt with by conventional water pumping methods such as sump pumping.

Consideration should be given to measures to protect site workers during groundworks, with particular attention given to the presence of asbestos fibres in the soil. Measures may also be required to protect new buried services from relatively high levels of TPH within the soil.

Part 1: INVESTIGATION REPORT

This section of the report details the objectives of the investigation, the work that has been carried out to meet these objectives and the results of the investigation. Interpretation of the findings is presented in Part 2.

1.0 INTRODUCTION

Geotechnical and Environmental Associates Limited (GEA) has been commissioned by Pinnacle Consulting Engineers Ltd, to carry out a desk study and ground investigation at Credit Suisse, Dundee Road, Slough, Berkshire SL1 4JU.

1.1 Proposed Development

It is understood that it is proposed to construct a new extension to the rear of the existing warehouse, along with the construction of new hardstanding and soakaways.

This report is specific to the proposed development and the advice herein should be reviewed if the development proposals are amended.

1.2 Purpose of Work

The principal technical objectives of the work carried out were as follows:

- to check the history of the site and surrounding area, particularly with respect to any previous or present contaminative uses;
- to determine the ground conditions and their engineering properties;
- to provide advice with respect to the design of spread foundations;
- to assess the feasibility of shallow soakaways;
- to provide advice with respect to the design of new areas of hardstanding;
- to provide an indication of the degree of soil contamination present; and
- to assess the risk that any such contamination may pose to the proposed development, its users or the wider environment in conjunction with the previous findings.

1.3 Scope of Work

In order to meet the above objectives, a desk study was carried out followed by a ground investigation. The desk study comprised the following activities:

- a review of historical Ordnance Survey (OS) maps and environmental searches sourced from the Envirocheck database;
- a review of readily available geology maps;
- an enquiry submitted to Slough Borough Council with regard to the history of the surrounding area; and
- a walkover survey of the site carried out at the time of the fieldwork;

In the light of this desk study, an intrusive ground investigation was carried out which comprised, in summary, the following activities:

- three boreholes advanced to depths of 4.00 m (29.09 m OD) and 6.00 m (27.05 m OD) by means of an opendrive percussive sampler (Terrier rig);
- the installation of two combined gas and groundwater monitoring standpipes to depths of 5.35 m (27.7 m OD) and 5.71 m (26.69 m OD) in Borehole Nos 1 and 3, with a single groundwater and gas monitoring visit carried out to date;
- three trial pits hand excavated to a maximum depth of 0.75 m (32.39 m OD) to investigate the foundations of the rear wall of the warehouse;
- in-situ California Bearing Ratio (CPR) testing in four locations;
- preliminary soakage testing in Borehole No 1 and 3 to provide information on permeability rates for shallow soakaway design;
- laboratory testing of selected soil samples for geotechnical purposes and for the presence of contamination; and
- provision of a report presenting and interpreting the above data, together with our advice and recommendations with respect to the proposed development.

The report includes a contaminated land assessment which has been undertaken in accordance with the methodology presented in Contaminated Land Report (CLR) 11[1] and involves identifying, making decisions on, and taking appropriate action to deal with, land contamination in a way that is consistent with government policies and legislation within the United Kingdom. The risk assessment is thus divided into three stages comprising Preliminary Risk Assessment, Generic Quantitative Risk Assessment, and Site-Specific Risk Assessment.

The exploratory methods adopted in this investigation have been selected on the basis of the constraints of the site including but not limited to access and space limitations, together with any budgetary or timing constraints. Where it has not been possible to reasonably use an EC7 compliant investigation technique a practical alternative has been adopted to obtain indicative soil parameters and any interpretation is based upon engineering experience, local precedent where applicable and relevant published information.

1.4 Limitations

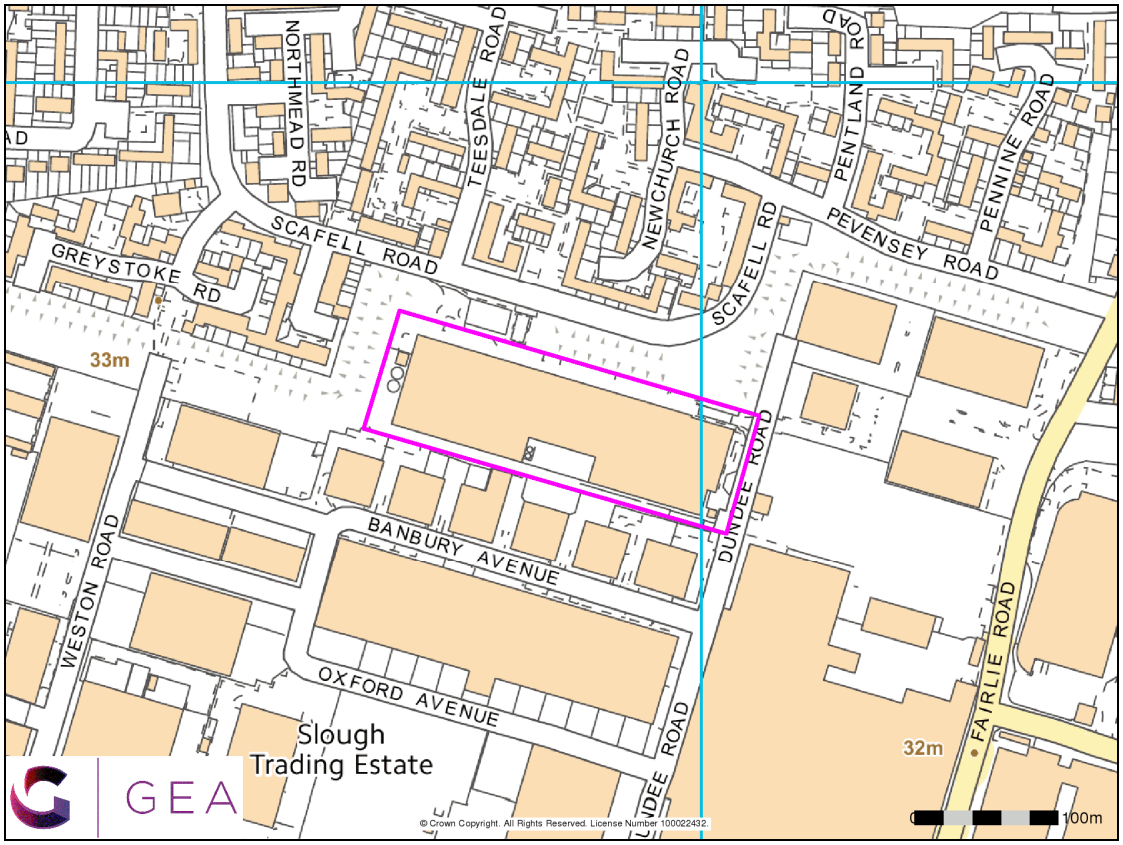

The conclusions and recommendations made in this report are limited to those that can be made on the basis of the investigation. The results of the work should be viewed in the context of the range of data sources consulted, the number of locations where the ground was sampled and the number of soil, gas or ground water samples tested. No liability can be accepted for conditions not revealed by the sampling or testing. Any comments made on the basis of information obtained from third parties are given in good faith on the assumption that the information is accurate; no independent validation of third party information has been made by GEA.

1 *Model Procedures for the Management of Land Contamination* issued jointly by the Environment Agency and the Department for Environment, Food and Rural Affairs (DEFRA) Sept 2004

2.0 THE SITE

2.1 Site Description

The site is located on Slough Trading Estate, approximately 900 m northeast of Burnham railway station. It fronts onto Dundee Road to the east, and is bordered by a number of warehouse type structures to the south and by a recreation ground to the north and west. The site may be additionally located by National Grid Reference 494900, 181760 and is shown on the map extract below.

A walkover of the site was carried out by a geotechnical engineer from GEA at the time of the fieldwork. The site is rectangular measuring approximately 260 m east-west by 85 m north-south. It is occupied by a centrally positioned double height warehouse, used as a data storage facility, which houses a number of electricity substations. Two large cylindrical sprinkler tanks are located adjacent to the building on the western side of the site. The site is essentially level and is largely occupied by the existing building, with hardstanding to the north, west and south, mainly used for vehicle access and parking. The investigation was concentrated in the west of the site, at the location of the proposed extension. The site was essentially devoid of vegetation and the concrete was noted to be in good condition.

2.2 Site History

The earliest map studied, dated 1876, shows the site and surrounding area to be largely undeveloped, with only an apparent small building, later marked as Cockfield Farm directly to the south of the centre of the site and a footpath crossing the centre of the site in a north to south alignment.

By 1924, the area approximately 80 m to the south of the site had been developed with a number of large industrial type buildings, including an artesian ice factory and jam factory. Railway tracks are shown to run in a northwest to southeast alignment directly to the north of these buildings and oil tanks are present approximately 120 m to the southwest of the site.

The 1932 map indicates that the jam factory had become a surgical dressing works, and a motor works was also present just to the southeast of the site. The 1955 map indicates that a foundry was located to the east of Cockfield Farm and the industrial area to the south of the site had a number of uses, including electrical and paint works, warehouses, depots and factories, all within 100 m south of the site. Cooling towers and an electrical sub-station are present approximately 70 m and 90 m to the southeast of the site, respectively.

By 1962, Cockfield Farm and the foundry had been cleared and the cooling towers replaced by a factory. By 1981, a large warehouse is shown to be present on site., with areas of semi-circular shaped pockets of soft landscaping in the southern elevation of the site. The area to the north and west of the site, including Scafell Road, had been developed with residential properties between 1981 and 1987, the surrounding area has since remained essentially unchanged.

By 1993 the number of soft landscaped areas on site is shown to have reduced from seven to three. Since 2006 and the present day, the warehouse is shown to have been extended further south and two tanks were added in the west of the site.

2.3 Other Information

A search of public registers and databases has been made via the Envirocheck database and relevant extracts from the search are appended. Full results of the search can be provided if required.

The desk study research has revealed that there are no existing landfill sites located within 280 m of the site, and additionally, no waste management facilities are located within 200 m of the site, with no waste treatment or disposal sites recorded within 260 m. However, the report indicates that the eastern portion of the site was previously a registered landfill, and is recorded as having accepted inert and parks waste, although the licence is recorded as lapsed with no end date given. An enquiry has been submitted to Slough Borough Council with regard to the history of this landfill and their findings contradict the Envirocheck records as they have reported that there are no registered landfills located within 250 m of the site.

Slough Heat and Power station is located approximately 450 m southwest and is currently regulated by the EA under a Part A1 Permit for waste treatment or disposal.

There are no Control of Major Accident Hazards (COMAH) sites, Notification of Installations Handling Hazardous Substances (NIHHS) points and no Planning Hazardous Substance Consents within 1 km of the site.

There are no Contamination Land Register Entries and Directories recorded within 1 km of the site, and there are no discharge consents or substantiated Pollution Incident Register entries within 400 m from site. There are no recorded pollution incidents to controlled waters recorded within 250 m of the site and no waste transfer sites recorded within 1 km of the site.

The search has indicated that the site is located in an area where less than 1% of homes are affected by radon emissions; which is the lowest classification given by the Health Protection Agency (HPA) and therefore no radon protective measures will be necessary.

The site is located within an EA designated Outer zone (Zone II) and Total Catchment Zone (Zone III) Source Protection Zone (SPZs). However, the site in not located within a Nitrate Vulnerable Zone or any other sensitive land uses.

The Envirocheck report indicates no fuel station entries within 600 m of the site. There are two active entries listed in the Contemporary Trade Directories within 100 m of the site; 'Glenmore-Hane Group' Sheet Metal Work, located 35 m to the west of the site and 'Mega-Pak' Packaging material manufactures and suppliers, located 94 m to the south.

The site is not within an area shown by the Environment Agency to be at risk from flooding from rivers or the sea, and does not lie within an area with the potential for groundwater flooding to occur.

Reference to records compiled by the Health Protection Agency (formerly the National Radiological Protection Board) indicates that the site falls within an area where less than 1% of homes are affected by radon emissions and therefore radon protective measures will not be necessary.

2.4 Geology

The British Geological Survey (BGS) map of the area (Sheet 255), indicates the site to be underlain by the Langley Silt Member over the Taplow Gravel Member overlying the Lambeth Group.

The Langley Silt Member typically comprises yellow brown silty clay, clayey silt or silt to clay, while the Taplow Gravel Member comprises sand and gravel, with occasional lenses of silt, clay or peat.

The Lambeth Group comprises variable sequences of clay, some silty or sandy, with some sands and gravels, minor limestones and lignites and occasional sandstone and conglomerate.

2.5 Hydrology and Hydrogeology

The Langley Silt, Taplow Gravel Member and Lambeth Group are all classified as Secondary 'A' Aquifers, which refer to permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.

The Envirocheck Report indicates that the nearest surface water feature is located 416 m west of the site, referring to a small stream. The River Thames is located approximately 2.3 km to the south of the site, and flows in a generally southerly direction. Groundwater is likely to flow in a generally southerly direction, towards the River Thames.

The permeability of the Taplow Gravel is expected to range between roughly 1 x 10^{-6} m/s and 1 x 10^{-4} m/s, whilst the permeability of the Lambeth Group is expected to vary in view of the clay, sand or gravel content.

The site is almost entirely covered by the existing building and hardstanding and therefore infiltration of rain water into the ground beneath the site is limited to cracks or damage in the hardstanding, such that the majority of surface runoff is likely to drain into combined sewers in the road.

2.6 Preliminary Risk Assessment

Consideration is being given to the construction of a new extension to the rear of the existing warehouse, along with the construction of new hardstanding and soakaway drainage. The end use will remain as commercial.

2.6.1 Environmental Risks

Part IIA of the Environmental Protection Act 1990, which was inserted into that Act by Section 57 of the Environment Act 1995, provides the main regulatory regime for the identification and remediation of contaminated land. As part of the regime, local authorities are required to carry out inspections of their area to identify sites that may be contaminated. The determination of contaminated sites is based on a "suitable for use" approach, which involves managing the risks posed by contaminated land by making risk-based decisions. This risk assessment is carried out on the basis of establishing one or more "pollution linkages"; a pollution linkage requires a source of contamination, a sensitive target or receptor that is at risk from the contamination and a pathway by which the contamination can travel from the source to the target.

A risk assessment should be carried out for consideration by the Local Planning Authority (LPA) before the planning application is determined. Where unacceptable risks are identified, proposals will need to be made to address these risks as part of the development process. The guidance recognises the benefits of a phased approach and the desk study is the first phase in the process of investigating and identifying contamination to assist in the determination of a planning application.

2.6.2 Source

The desk study findings indicate the site not to have had a potentially contaminative history as it has only been occupied by the existing warehouse since 1981. Localised fuel spillages may have occurred in the car parks on site, which could represent a source of hydrocarbon contamination.

The industrial area located in close proximity to the south of the site could also represent a potential source of contamination. However, in view of the distance, extent of hardstanding and the fact that it is not located upstream, it is not considered to represent a significant risk.

According to the Envirocheck report, a registered landfill was located in the eastern portion of the site, although the findings of an enquiry submitted to Slough Borough Council indicates that there are no registered landfills within 250 m of the site.

2.6.3 Receptor

The future end users of the commercial building will represent moderate sensitivity receptors. The site is underlain by Secondary 'A' Aquifers and therefore groundwater is considered to be a relatively sensitive receptor. Buried services are likely to come into contact with any contaminants present within the soils through which they pass and site workers are likely to come into contact with any contaminants present during demolition and construction works.

2.6.4 Pathway

As the site is to be developed with a new extension to the rear and external areas of hardstanding, there should not be be any potential contaminant exposure pathways in the form of direct soil and indoor dust ingestion to end users. However, the site and surrounding area are underlain by River Terrace Deposits, which comprise predominantly granular soils and therefore provide a potential pathway for leachable contaminants to migrate in the groundwater onto or off site. The groundworks are considered to be a pathway by which site workers and new buried plastic services may come into contact with contaminants within the underlying soils. There is thus considered to be a moderate potential for a significant contaminant pathway to be present between any potential contaminant source and a target for the particular contaminant.

2.6.5 Preliminary Risk Appraisal

On the basis of the above it is considered that there is a LOW RISK of there being present a significant contaminant linkage at this site between the soil and sensitive receptors that could result in a requirement for remediation work.

3.0 EXPLORATORY WORK

In order to meet the objectives described in Section 1.2, three boreholes were advanced to depths of 4.00 m and 6.00 m using an opendrive sampler rig, and three hand excavated trial pits were advanced to a maximum depth of 0.75 m to expose the existing foundations of the rear wall of the warehouse.

During boring, disturbed samples were obtained from the boreholes for subsequent laboratory examination and testing. Standard Penetration Tests (SPTs) were carried out at regular intervals to provide additional quantitative data on the strength of soils encountered.

Two combined gas and groundwater monitoring standpipes have been installed to depths of 5.35 m and 5.71 m to facilitate gas and groundwater monitoring, which has been carried out on a single occasion to date, approximately two weeks after installation. Additionally, preliminary soakage tests were undertaken within the standpipes.

A selection of the samples recovered from the boreholes was submitted to a soil mechanics laboratory for a programme of geotechnical testing and an analytical laboratory for a programme of contamination testing.

All of the above work was carried out under the supervision of a geotechnical engineer from GEA. The borehole and trial pit records and results of the laboratory analyses are appended together with a site plan indicating the exploratory positions. The Ordnance Datum (OD) levels shown on the borehole and trial pit records have been interpolated from an unreferenced and undated drawing provided by the client.

3.1 Sampling Strategy

The borehole and trail pit locations were agreed with the client and were positioned on site by an engineer from GEA to provide optimum coverage of the site whilst avoiding areas of known and suspected services.

Three samples of the made ground have been tested for the presence of contamination. The analytical suite of testing was selected to identify a range of common industrial contaminants and contamination indicative parameters. For this investigation the analytical suite for the soil included a range of metals, speciation of total petroleum hydrocarbons (TPH), polycyclic

aromatic hydrocarbons (PAH), total cyanide, monohydric phenols and screened for the presence of asbestos. The soil samples were selected to provide a general view of the chemical conditions of the soils that are likely to be involved in a human exposure or groundwater pathway and to provide advice in respect of re-use or for waste disposal classification.

The contamination analyses were carried out at an MCERTs accredited laboratory with the majority of the testing suite accredited to MCERTS standards. A summary of the MCERTs accreditation and test methods are included with the attached results and further details are available upon request.

Selected samples of the natural soils were submitted for routine geotechnical testing. The tests scheduled included moisture content, atterberg limits, sieve analysis, sulphate and pH analysis.

4.0 GROUND CONDITIONS

The investigation has generally confirmed the expected ground conditions in that, beneath a moderate thickness of made ground, Langley Silt Member was encountered over Taplow Gravel which was proved to the maximum depth investigated of 6.00 m (26.40 m OD).

4.1 Made Ground

The made ground generally comprised light grey silty slightly clayey gravelly sand or sandy gravel with frequent fragments of concrete, brick and some clinker extending to depths of between 0.40 m (32.00 m OD) and 0.52 m (31.74 m OD).

Apart from the presence of fragments of extraneous material noted above, no visual or olfactory evidence of contamination was observed during the fieldwork. Five samples of the made ground has however been analysed for a range of contaminants as a precautionary measure and the results are detailed within Section 4.6.

4.2 Langley Silt

This material comprised an initial horizon of soft greyish black silty clay with carbonaceous material encountered in Borehole No 1 and 2 only, to a maximum depth of 0.50 m (32.55 m OD). Beneath this layer, this stratum generally comprised firm brown silty slightly sandy slightly gravelly clay with some decayed roots and carbonaceous material and extended to depths of between 2.10 m (30.3 m OD) and 3.00 m (30.09 m OD).

The results of laboratory modified plasticity index tests carried out on two samples indicate the clay to be of moderate volume change potential, with moisture contents of 14% and 18%.

4.3 Taplow Gravel

This stratum comprised an initial horizon of firm light yellowish brown firm sandy slightly gravelly clay with a thickness of between 0.2 m and 0.5 m, becoming dense light yellow clayey silty sand in Borehole Nos 1 and 3 only, to depths of 4.00 m (29.07 m OD) and 5.10 m (27.3 m OD). Below this depth, this stratum comprised dense light yellow and greyish brown clayey silty sand and gravel which was proved to the maximum depth investigated of 6.00 m (26.40 m OD).

In Borehole No 2, the Taplow Gravel was encountered at a depth of 3.00 m (30.09 m OD) and comprised very dense light brown very sandy gravel to the maximum depth investigated of 4.00 m (29.09 m OD).

The results of laboratory modified plasticity index testing have indicated the clay layers to be of low volume change potential with moisture contents ranging from 14% to 19%.

4.4 Groundwater

Groundwater was encountered at a depth of approximately 5.00 m (28.09 m OD) within Borehole Nos 1 and 3, during drilling and has been measured at depths of 4.93 m (28.12 m OD) and 5.00 m (m OD), in Borehole Nos 1 and 3, during a single monitoring visit carried out to date.

4.5 Soil Contamination

The table below sets out the values measured within the three samples analysed; all concentrations are in mg/kg unless otherwise stated.

Determinant	BH1 0.30 m	BH2 0.20 m	BH3 0.40 m
pH	9.1	10.7	10.3
Arsenic	8.0	10	16
Cadmium	<0.2	<0.2	<0.2
Chromium	23	24	26
Copper	30	78	210
Lead	26	34	37
Mercury	<0.3	<0.3	<0.3
Nickel	16	20	29
Selenium	<1.0	<1.0	<1.0
Zinc	57	97	56
Total Cyanide	<1.0	<1.0	<1.0
Total Phenols	<1.0	<1.0	<1.0
Total PAH	3.18	16.4	13.2
Sulphide	17	8.7	1.4
Benzo(a)pyrene	<0.05	1.6	1.1
Naphthalene	<0.05	<0.05	<0.05
TPH	1700	920	290
Total Organic Carbon %	0.80	1.0	0.5

Note: Figure in **bold** indicates concentration in excess of risk-based soil guideline values, as discussed in Part 2 of this report

The chemical analyses have not indicated any elevated concentrations of contaminants with respect to commercial end use. However, a single sample retrieved from Borehole No 2 at a depth of 0.20 m was found to contain loose fibres, hard/cement type material and sheeting board debris of asbestos (chrysotile and amosite). Subsequent quantification testing has indicated the asbestos to be at a low concentration of 0.028%.

4.5.1 Generic Quantitative Risk Assessment

The use of a risk-based approach has been adopted to provide an initial screening of the test results to assess the need for subsequent site-specific risk assessments. Contaminants of concern are those that have a value in excess of a generic human health risk based guideline values, which is either the CLEA Soil Guideline Value where available, a Generic Screening Value calculated using the CLEA UK Version 1.06 software assuming a commercial end use, or is based on the DEFRA Category 4 Screening values. The key generic assumptions for this end use are as follows:

- that groundwater will not be a critical risk receptor;
- that the critical receptor for human health will be a working female aged 16 to 65 years old;
- that the exposure duration will be 49 years;
- that the critical exposure pathways will be direct soil and indoor dust ingestion, skin contact with soils and dust, and inhalation of dust and vapours; and
- that the building type equates to a three-storey office.

It is considered that these assumptions are acceptable for this generic assessment of this site. The tables of generic screening values derived by GEA and an explanation of how each value has been derived are included in the Appendix.

Where contaminant concentrations are measured at concentrations below the generic screening value it is considered that they pose an acceptable level of risk and thus further consideration of these contaminant concentrations is not required. However, where concentrations are measured in excess of these generic screening values there is considered to be a potential that they could pose an unacceptable risk and thus further action will be required which could include;

- additional testing to zone the extent of the contaminated material and thus reduce the uncertainty with regard to its potential risk;
- site specific risk assessment to refine the assessment criteria and allow an assessment to be made as to whether the concentration present would pose an unacceptable risk at this site; or
- soil remediation or risk management to mitigate the risk posed by the contaminant to a degree that it poses an acceptable risk.

The testing has indicated all of the samples tested to be free from elevated concentrations of contaminants when compared to Soil Guideline Values and Generic Screening Values for the continued commercial end use. Relatively high concentrations of TPH (total petroleum hydrocarbon) were recorded in all of the samples tested. However, subsequent speciated analysis has shown that none of the aliphatic or aromatic compounds have concentrations above their individual screening values.

Asbestos screening has identified the presence of loose fibres of amosite asbestos and hard cement type material of chrysotile asbestos in a single sample of the made ground, although it was found at a trace concentration of 0.028%, such that the asbestos is unlikely to present a significant risk to human health.

The significance of these results is considered further in Part 2 of the report

4.6 Soil Gas

Gas monitoring has been carried out on a single occasion to date. The monitoring results are appended and indicate no methane or hydrogen sulphide to have been detected. Depleted oxygen concentrations of 7.7% and 14.2 % were measured in the standpipes. No flow was measured, with very low carbon monoxide in Borehole No 3. In addition, very low Volatile Organic Compounds (VOCs) were detected during gas monitoring with the PID, with a maximum concentration of 1.3 ppm.

In determining the significance of soil gas concentrations, both the gas concentrations and borehole flow rates are used to define a characteristic situation for a site based on the limiting borehole gas volume flow, renamed as the Gas Screening Value (GSV) for methane and carbon dioxide. In this case the following GSVs have been determined, in accordance with guidance provided by CIRIA[2].

Gas	Max concentration % vol	Max flow rate l/hr	GSV
Methane	<0.1	0.1	0.0001
Carbon dioxide	1.5	0.1	0.0015

The gas screening value is calculated using the following formula:

$$GSV = flow\ rate \times (concentration\ of\ gas / 100)$$

On the basis of the above, the GSV indicates that the site would be defined as Characteristic Situation 1 (CS1), which is defined as very low risk. In accordance with BS 8485[3] the proposed development is likely to be classified as a Type D building, comprising commercial / public buildings. Table 4 of BS 8485 indicates the minimum gas protection score (points) for each type of building (A-D) using the CS level (1-6) previously determined. A Type D building with CS1 requires zero points in reference to gas protection measures. At this stage gas protection is not deemed to be required, but further gas monitoring may be required to confirm this view.

The significance of these results is considered further in Part 2 of the report.

3 The British Standards Institution (2015), *BS 8484:2015 Code of practice for the design of protective measures for methane and carbon dioxide ground gases for new buildings.* 2nd Ed. BSI Standards Ltd

4.7 Existing Foundations

The findings of the trial pits are summarised in the table below. Sketches and photographs of each pit are included in the Appendix.

Trial Pit No	Structure	Foundation detail	Bearing Stratum
1	Western elevation of existing building (SW corner)	Concrete slab Top: GL to 0.50 m Base: not determined Lateral projection: not determined	Not determined – concrete slab
2	Western central elevation of existing building	Concrete slab Top: GL to 0.25 m Base not determined Lateral projection: not determined	Not determined – concrete slab
3	Western elevation of existing building (NW corner)	Concrete strip / trench fill Top: GL Base: 0.52 m Lateral projection 150 mm	Light brown slightly gravelly clay. Gravel is fine, subrounded flint.

Part 2: DESIGN BASIS REPORT

This section of the report provides an interpretation of the findings detailed in Part 1, in the form of a ground model, and then provides advice and recommendations with respect to the proposed development.

5.0 INTRODUCTION

Consideration is being given to the construction of a new extension to the rear of the existing Credit Suisse, along with the construction of new hardstanding and soakaway drainage. The end use will remain commercial. The loads are not known but are anticipated to be light to moderate.

6.0 GROUND MODEL

The desk study findings indicate that the site does not have a potentially contaminative history as it has only been occupied by the existing warehouse since 1981, and on the basis of the fieldwork, the ground conditions at this site can be characterised as follows:

- beneath a moderate thickness of made ground, Langley Silt is present over Taplow Gravel which was proved to the maximum depth investigated of 6.00 m (26.40 m OD);
- the made ground generally comprises light grey silty slightly clayey gravelly sand or sandy gravel with frequent fragments of concrete, brick and some clinker extending to depths of between 0.40 m (32.00 m OD) and 0.52 m (31.74 m OD);
- the Langley Silt comprises an initial horizon of soft greyish black silty clay with some carbonaceous material to a maximum depth of 0.50 m (32.55 m OD). Beneath this layer, this stratum generally comprises firm brown silty slightly sandy slightly gravelly clay with some decayed roots and carbonaceous material and extends to depths of between 2.10 m (30.3 m OD) and 3.00 m (30.09 m OD);
- moderate volume change potential clays should be assumed;
- the Taplow Gravel initially consists of firm light yellowish brown firm light yellowish brown sandy slightly gravelly clay becoming dense light yellow clayey silty sand to depths of between 4.00 m (29.07 m OD) and 5.10 m (27.3 m OD). Below this depth, this stratum comprises dense light yellow and greyish brown clayey silty sand and gravel and extends to the full depth of the investigation, of 6.00 m (26.40 m OD). In borehole No 2, the Taplow Gravel was encountered at a depth of 3.00 (30.09 m OD) and comprises very dense light brown very sandy gravel to the maximum depth investigated, of 4.00 m (29.09 m OD);
- groundwater is present within the Taplow Gravel at a minimum depth of 4.93 m (28.12 m OD);

- the contamination testing has not indicated any elevated concentrations of contaminants above a commercial use. Asbestos has been detected with a single sample of made ground screened, although it was at a low concentration of 0.028%; and

- no abnormal gas concentrations have been measured during a single monitoring visit.

7.0 ADVICE AND RECOMMENDATIONS

The firm clay of the Langley Silt Member or underlying should provide a suitable bearing stratum for the support of the anticipated light to moderate loads by means of spread foundations.

7.1 Spread Foundations

Moderate width pad or strip foundations bearing in the firm clay of the Langley Silt Member, may be designed to apply a net allowable bearing pressure of 100 kN/m^2 increasing to 175 kN/m^2 if extended into the dense clayey silty sand of the Taplow Gravel Member which was present below a depth of 2.00 m in Borehole Nos 1 and 3 only. These values incorporate an adequate factor of safety against bearing capacity failure and should ensure that settlement remains within normal tolerable limits. The recommended bearing pressures take account of the variable nature of the soils and any foundations should be nominally reinforced where they span clay and granular material to protect against differential settlement

Any made ground and soft clay should be by-passed and foundations should be placed at a minimum depth of 0.9 m, assuming that restrictions are applied on planting of shrubs in the vicinity of foundations, or at a depth of 1.25 m if there is unrestricted planting of shrubs in the new development, subject also to the further restrictions on new tree planting as detailed in the NHBC guidelines.

7.2 Shallow Excavations

On the basis of the borehole and trial pit findings it is considered that shallow excavations that extend through the made ground and clay of Langley Silt Member are likely to remain relatively stable in the short term without the requirement for lateral support, although localised instabilities may occur, particular where perched water is encountered or where the more granular soils of the Taplow Gravel Member are exposed.

Should deeper excavations be considered or if excavations are to remain open for prolonged periods it is recommended that provision be made for battered side slopes or lateral support. Where personnel are required to enter excavations, a risk assessment should be carried out and temporary lateral support or battering of the excavation sides considered in order to comply with normal safety requirements.

Inflows of groundwater into shallow excavations are not generally anticipated although inflows of perched water may occur from within the made ground, particularly in the vicinity of existing foundations. Any such occurrences should be adequately dealt with by sump pumping.

7.3 Effect of Sulphates

Three samples of the made ground and six samples of the natural soil have been tested for total sulphates. Chemical analyses within the made ground has revealed low concentrations of soluble sulphate and near-neutral pH in accordance with Class DS-2 conditions of Table C2 of BRE Special Digest 1:SD Third Edition (2005). The measured pH values of the samples show that an ACEC class of AC-1d would be appropriate for the site. This assumes a mobile water condition at the site. The results within the natural soils indicate low concentrations of soluble sulphates and near neutral pH, in accordance with Class DS-1 and an ACEC class of AC-1s assuming static water conditions. The guidelines contained in the digest should be followed in the design of foundation concrete.

7.4 Surface Water Disposal

Two falling head tests were undertaken in Borehole Nos 1 and 3 at depths of 5.35 m (27.74 m OD) and 5.71 m (26.69 m OD). The tests yielded soakage rates of between 1.0 x 10^{-5} m/s to 9 x 10^{-6} m/s. On the basis of the results it is likely to be feasible to adopt borehole soakaways in the Taplow Gravel Member.

7.5 Pavement Design

In-situ California Bearing Ratio CBR testing was carried out in four locations. Formation level for the proposed new hardstanding is likely to be within the made ground. New hardstanding should be designed on the basis of a California Bearing Ratio (CBR) of 2.5%. A CBR value of 43 % in CBR 3 was disregarded as the increased ratio was attributed to the presence of gravel.

Prior to construction it would be prudent to proof roll the formation level and infill any soft spots with suitably compacted granular material.

7.6 Contamination Risk Assessment

The desk study research has indicated the site not to have had a potentially contaminative history, having been occupied by by the existing warehouse since 1981.

The contamination testing has indicated all of the three samples tested to be free from elevated concentrations of contaminants with respect to the proposed commercial end use, although relatively high concentrations of TPH have been recorded in all of the samples tested. In addition, a single sample screened for asbestos was found to contain hard/cement type material and loose fibres of chrysotile and amosite asbestos. Although, subsequent quantification testing has indicated a low concentration of 0.028%.

The exact source of the relatively high concentrations of TPH is unknown, but the made ground was noted as containing variable inclusions of extraneous material, which if present in the samples tested may have accounted for the concentrations. In any case, the contamination is not considered likely to be in a soluble form and therefore does not pose a risk to groundwater and thus neighboring sites. However, given that the site is located within an Outer zone (Zone II) and Catchment Zone (Zone III) Source Protection Zone, consultation with the local Environmental Health Officer and / or the Environment Agency may be required. The contamination may pose a risk to buried services and site workers during the groundworks, as discussed below.

7.6.1 Site Workers

Site workers should be made aware of the potential contamination and a programme of working should be identified to protect workers handling any soil. The method of site working should be in accordance with guidelines set out by HSE[4] and CIRIA[5] and the requirements of the Local Authority Environmental Health Officer.

A watching brief should also be maintained during the groundwork, and if suspicious soils are encountered then a suitably qualified engineer should inspect the soils, with further testing carried out if required.

7.6.2 Buried Services

In view of the concentrations of hydrocarbon contaminants, consideration may need to be given to the protection of buried plastic services within the underlying soils. Details of the proposed protection measures for buried plastic services will in any case need to be approved by the EHO and the relevant service authority prior to the adoption of any scheme. It is however likely that barrier pipe will be required.

7.7 Waste Disposal

Under the European Waste Directive, waste is classified as being either Hazardous or Non-Hazardous and landfills receiving waste are classified as accepting hazardous or non-hazardous wastes or the non-hazardous sub-category of inert waste in accordance with the Waste Directive. Waste classification is a staged process and this investigation represents the preliminary sampling exercise of that process. Once the extent and location of the waste that is to be removed has been defined, further sampling and testing may be necessary. The results from this ground investigation should be used to help define the sampling plan for such further testing, which could include WAC leaching tests where the totals analysis indicates the soil to be a hazardous waste or inert waste from a contaminated site. It should however be noted that the Environment Agency guidance WM3[6] states that landfill WAC analysis, specifically leaching test results, must not be used for waste classification purposes.

Any spoil arising from excavations or landscaping works, which is not to be re-used in accordance with the CL:AIRE[7] guidance, will need to be disposed of to a licensed tip. Waste going to landfill is subject to landfill tax at either the standard rate of £88.95 per tonne (about £160 per m^3) or at the lower rate of £2.80 per tonne (roughly £5 per m^3). However, the classifications for tax purposes and disposal purposes differ and currently all made ground and topsoil is taxable at the 'standard' rate and only naturally occurring soil and stones, which are accurately described as such in terms of the 2011 Order, would qualify for the 'lower rate' of landfill tax.

Based upon on the technical guidance provided by the EA it is considered likely that the soils encountered during this ground investigation, as represented by the chemical analyses carried out, would be generally classified as follows;

4 HSE (1992) HS(G)66 *Protection of workers and the general public during the development of contaminated land* HMSO
5 CIRIA (1996) *A guide for safe working on contaminated sites* Report 132, Construction Industry Research and Information Association
6 Environment Agency 2015. *Guidance on the classification and assessment of waste.* Technical Guidance WM3 First Edition
7 CL:AIRE March 2011. *The Definition of Waste: Development Industry Code of Practice* Version 2

Soil Type	Waste Classification (Waste Code)	WAC Testing Required Prior to Landfill Disposal?	Comment
Made Ground (BH1)	Hazardous (17 05 03)	Yes	HP7 Carcinogen
Made ground	Non-hazardous (17 05 04)	No	-
Natural Soils	Inert (17 05 04)	Should not be required but confirm with receiving landfill	-

Under the requirements of the European Waste Directive all waste needs to be pre-treated prior to disposal. The pre-treatment process must be physical, thermal, chemical or biological, including sorting. It must change the characteristics of the waste in order to reduce its volume, hazardous nature, facilitate handling or enhance recovery. The waste producer can carry out the treatment but they will need to provide documentation to prove that this has been carried out. Alternatively, the treatment can be carried out by an approved contractor. The Environment Agency has issued a position paper[8] which states that in certain circumstances, segregation at source may be considered as pre-treatment and thus excavated material may not have to be treated prior to landfilling if the soils can be segregated onsite prior to excavation by sufficiently characterising the soils insitu prior to excavation.

The above opinion with regard to the classification of the excavated soils is provided for guidance only and should be confirmed by the receiving landfill once the soils to be discarded have been identified.

The local waste regulation department of the Environment Agency (EA) should be contacted to obtain details of tips that are licensed to accept the soil represented by the test results. The tips will be able to provide costs for disposing of this material but may require further testing.

8.0 OUTSTANDING RISKS AND ISSUES

This section of the report aims to highlight areas where further work is required as a result of limitations on the scope of this investigation, or where issues have been identified by this investigation that warrant further consideration. The scope of risks and issues discussed in this section is by no means exhaustive, but covers the main areas where additional work may be required.

The ground is a heterogeneous natural material and variations will inevitably arise between the locations at which it is investigated. This report provides an assessment of the ground conditions based on the discrete points at which the ground was sampled, but the ground conditions should be subject to review as the work proceeds to ensure that any variations from the Ground Model are properly assessed by a suitably qualified person.

Monitoring of the standpipes should be continued to determine equilibrium groundwater levels and to establish any seasonal fluctuations.

If during ground works any visual or olfactory evidence of contamination is identified it is recommended that further investigation be carried out and that the risk assessment is reviewed.

These areas of doubt should be drawn to the attention of prospective contractors and further investigation will be required or sufficient contingency should be provided to cover the outstanding risk

8 Environment Agency 23 Oct 2007 *Regulatory Position Statement Treating non-hazardous waste for landfill - Enforcing the new requirement*

Signed:

Jordan Hill
Reporting Manager
For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Analytical Report Number : 18-96311

Project / Site name: Dundee Road

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
1022760	BH1	None Supplied	0.30	Brown clay and sand with brick and rubble.
1022761	BH2	None Supplied	0.20	Brown clay and sand with rubble and gravel
1022762	BH3	None Supplied	0.40	Brown clay and sand with rubble.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Project / Site name: Dundee Road

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
BTEX and MTBE in soil (Monoaromatics)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073B-PL	W	MCERTS
Chloride, water soluble, in soil	Determination of Chloride colorimetrically by discrete analyser.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests. 2:1 extraction.	L082-PL	D	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 2, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests, 2:1 water:soil extraction, analysis by ICP-OES.	L038-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests""	L009-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L038-PL	D	MCERTS
TPH Banding in Soil by FID	Determination of hexane extractable hydrocarbons in soil by GC-FID.	In-house method, TPH with carbon banding.	L076-PL	W	MCERTS
TPH in (Soil)	Determination of TPH bands by HS-GC-MS/GC-FID	In-house method, TPH with carbon banding.	L076-PL	D	MCERTS
TPHCWG (Soil)	Determination of hexane extractable hydrocarbons in soil by GC-MS/GC-FID.	In-house method	L088/76-PL	W	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Certificate of Analysis - Asbestos Quantification

Methods:

Qualitative Analysis

The samples were analysed qualitatively for asbestos by polarising light and dispersion staining as described by the Health and Safety Executive in HSG 248.

Quantitative Analysis

The analysis was carried out using our documented in-house method A006 based on HSE Contract Research Report No: 83/1996: Development and Validation of an analytical method to determine the amount of asbestos in soils and loose aggregates (Davies et al, 1996) and HSG 248. Our method includes initial examination of the entire representative sample, then fractionation and detailed analysis of each fraction, with quantification by hand picking and weighing.

The limit of detection (reporting limit) of this method is 0.001 %.

The method has been validated using samples of at least 100 g, results for samples smaller than this should be interpreted with caution.

Both Qualitative and Quantitative Analyses are UKAS accredited.

Sample Number	Sample ID	Sample Depth (m)	Sample Weight (g)	Asbestos Containing Material Types Detected (ACM)	PLM Results	Asbestos by hand picking/weighing (%)	Total % Asbestos in Sample
1022761	BH2	0.20	106	Hard/Cement Type Material & Loose Fibres & Sheeting/Board Debris	**Chrysotile & Amosite**	0.028	**0.028**

Opinions and interpretations expressed herein are outside the scope of UKAS accreditation.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Analytical Report Number : 18-96311

Project / Site name: Dundee Road

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
1022760	BH1	None Supplied	0.30	Brown clay and sand with brick and rubble.
1022761	BH2	None Supplied	0.20	Brown clay and sand with rubble and gravel
1022762	BH3	None Supplied	0.40	Brown clay and sand with rubble.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Analytical Report Number : 18-96311

Project / Site name: Dundee Road

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Asbestos Quantification - Gravimetric	Asbestos quantification by gravimetric method - in house method based on references.	HSE Report No: 83/1996, HSG 248, HSG 264 & SCA Blue Book (draft).	A006-PL	D	ISO 17025
BTEX and MTBE in soil (Monoaromatics)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073B-PL	W	MCERTS
Chloride, water soluble, in soil	Determination of Chloride colorimetrically by discrete analyser.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests. 2:1 extraction.	L082-PL	D	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 2, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests, 2:1 water:soil extraction, analysis by ICP-OES.	L038-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests""	L009-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L038-PL	D	MCERTS
TPH Banding in Soil by FID	Determination of hexane extractable hydrocarbons in soil by GC-FID.	In-house method, TPH with carbon banding.	L076-PL	W	MCERTS
TPH in (Soil)	Determination of TPH bands by HS-GC-MS/GC-FID	In-house method, TPH with carbon banding.	L076-PL	D	MCERTS

Analytical Report Number : 18-96311

Project / Site name: Dundee Road

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
TPHCWG (Soil)	Determination of hexane extractable hydrocarbons in soil by GC-MS/GC-FID.	In-house method	L088/76-PL	W	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

1,2-dichloroethane (DCA)	1	LQM/CIEH
vinyl chloride (Chloroethene)	0.113	LQM/CIEH
tetrachloromethane (Carbon tetra	6.6	LQM/CIEH
trichloromethane (Chloroform)	180	LQM/CIEH

Notes

Concentrations measured below the above values may be considered to represent 'uncontaminated conditions' which pose 'LOW' risk to human health. Concentrations measured in excess of these values indicate a potential risk which require further, site specific risk assessment.

SGV - Soil Guideline Value, derived from the CLEA model and published by Environment Agency 2009

LQM/CIEH - Generic Assessment Criteria for Human Health Risk Assessment 2nd edition (2009)derived using CLEA 1.04 model 2009

C4SL - Defra Category 4 Screening value based on Low Level of Toxicological Risk

C4SL exp & LQM/CIEH calculated using C4SL revisions to exposure assessment but LQM/CIEH health criteria values

Calc - sum of nearest available carbon range specified including BTEX for PRO fraction

B(a)P / 0.15 - GEA experience indicates that Benzo(a) pyrene (one of the most common and most carcinogenic of the PAHs) rarely exceeds 15% of the total PAH concentration, hence this Total PAH threshold is regarded as being conservative

1. Environmental Enquiry Report

Site Centre Coordinates (British National Grid): 494898, 181764
Enquiry site search radius: 100 and 500 metres
Selection Summary: A total of 56 features were selected on 6 out of 17 target layers.

2. Enquiry Response

I wish at this point to draw your attention to the Council's disclaimer in respect of contaminated land queries, which is reproduced at the end of this report.

Slough Borough Council has published its strategy for the inspection of contaminated land as part of its duties under the contaminated land regime. The Council is reviewing map and other information sources to identify potentially contaminative historical and current land uses in order to assess the risk of contamination of land within the Borough. The Council will be inspecting those sites identified as potentially contaminated through this data review process on a risk based approach. Sites which have been designated as Contaminated under Part 2A of the Environmental Protection Act 1990 can be viewed at www.slough.gov.uk.

This site has been identified as medium risk site, ranked as part of the Council's Inspection Prioritisation Procedure, but it is not currently considered a priority site for further investigation.

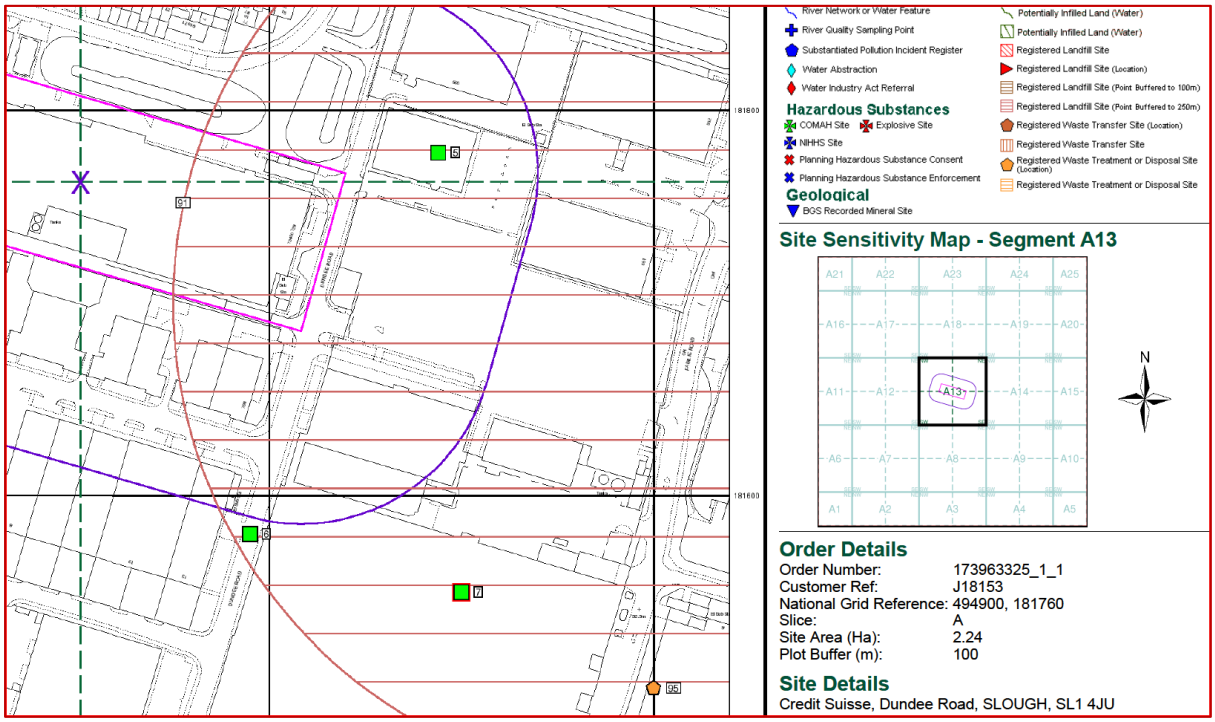

While the Council does not at this time intend to carry out a detailed inspection of the site or any adjoining or adjacent land, this does not mean that the Council will not plan to carry out such inspection(s) at a future date, should available information reflect the need for an inspection as per the legislative guidance.

The following sections provide the detailed response to your specific enquiry:

- **From the plan provided, the eastern portion of the site is within a hatched area, which represents a registered landfill site (point buffered to 100 m). This appears to be registered landfill, located on Fairlie Road, Slough, Licence ref 54/12/4/10. Is there any further information that you can provide on this landfill?**

  The site you are referring to is the one represented on the map provided (replicated below) by a light orange pentagon, which according to the map's legend is a Registered Waste Treatment or Disposal Site (location), not a registered landfill. There is no Registered Landfill is located anywhere within 250m of the sit. However, the closest historic landfill is more than 300m away.

  The site that you are referring to is the Slough Heat and Power Station, which is regulated by the EA under a Part A1 Permit, as set out in the Environmental Permitting Regulations 2016. However, I could not find anything relating to the licence reference you mentioned above.

SI/000094	**Scafell Road**	**Northborough Play Area**	**0**	**2487**	**494843, 181842**

Site Investigation Report Summary

The site came to light as SBC are looking to add a children's play area. Dorothy Jackman from Groundwork telephoned stating that someone from housing had said the bund which separates the residential development from the trading estate was full of toxic waste. A review of the information held showed that the nature of the bund material was unknown. I therefore suggested that this is further investigated.

GEA (22 October 2004) *Northborough Play Area, Scafell Road, Slough.* Letter Ref No: J04191/CMB

Brief

Instructed to carry out a desk study and ground investigation, with respect to the play area and ball court on the buffer strip between the Slough Trading Estate and Northborough Road Housing Estate.

The site

At the time of investigation the site was occupied with five large earth bunds with a small car park and an area of hardstanding towards the middle of the site. The mounds are approximately 3m high and 20m wide with a length from approx. 50-100m. They are grassed with some saplings.

Desk Study Findings

The history has been researched using historical maps sourced from the Envirocheck database.
The earliest map (1876) shows the site and area to be fields, the Trading estate was developed around 1918 as part of a military vehicle depot which was never completed. By 1924 development of this part of the trading estate had begun to the south. The trading estate expanded until some time between 1961-2 when a housing estate was constructed to the west. Between 1962-71 the trading estate encroached up to the southern most boundary of the site and between 1976-82 the housing estate immediately to the north. During the time the mounds had been placed along with the area of hardstanding.
The site is on brickearth over Taplow Gravel. There are four registered landfills within 250m east and northeast of the site. Though known hold an active licence

Fieldwork

A total of 13 boreholes were advanced to a max depth of 5m below ground level using a percussive window sampler.

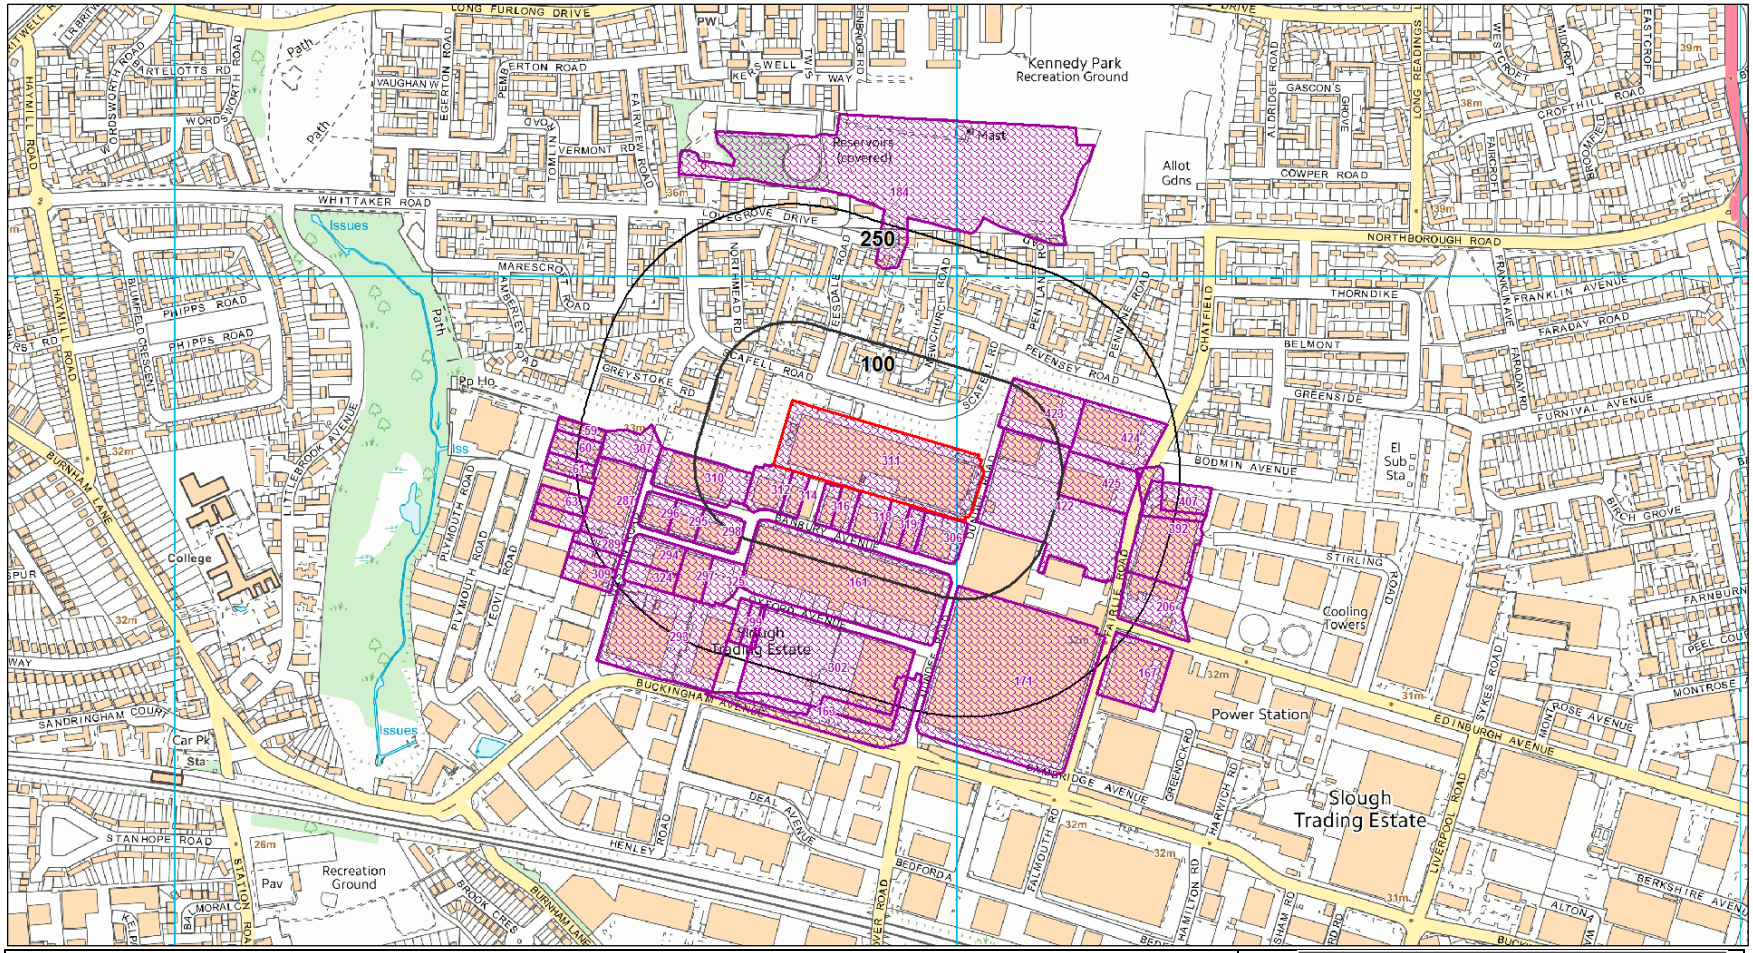

Beneath the grass made ground, generally comprising brown sandy clay with brick, clinker, glass, ceramic, concrete, metal, paper, rubber, plastic and gravel. Some boreholes had to be terminated following shallow obstructions

The made ground in the area of the proposed ball court had nominal thickness of made ground. This was generally orange-brown silty clay with occasional gravel, with the exception of Bh10 where a thin layer of gravelly sand was encountered beneath the made ground.
Desiccation was identified at seven location and to a max depth of 2m. Groundwater was not encountered.

	Max Con	Min Con	Uncontaminated Value
Arsenic	20	12	20
Cadmium	9.1	<0.5	8
Chromium	190	27	130
Lead	150	18	450
Mercury	0.6	<0.3	8

Zinc	390	59	300
Total Cyanide	<5	<5	25
Total Phenols	<3	<3	5
Sulphide	50	<10	250

ID	Site Name	Address	Approx. distance (m)	Approx. Area (m^2)	Grid Reference
The desk study has shown that the site has not been subject to a potentially contaminative history. Chemical analysis of the mounds has revealed generally low concentrations of contaminants to be present, and although slightly elevated concentrations of cadmium, chromium, copper and zinc were present in Borehole 5 the US95 values for these contaminants are well below the respective uncontaminated values. The results of the contamination testing do not give any cause for concern with respect to the proposed development. **Concerns** **No potentially contaminative use, however I thought the problem arose from the uncertainty on the source of the bund material!** **There is no source of the values labelled 'uncontaminated' within the table of results. This heading is misleading and appears to suggest that these values are considered background levels. It appears that seven of these values are actually the Soil Guideline Value for a residential with plant uptake, and these not indicative of being uncontaminated. They represent "intervention values", indicators to an assessor that soil concentrations above this level might present an unacceptable risk to the health of site-users and that further investigation and/or remediation is required** **The US95 should only be applied in the UK using the approach outlined in CLR7, I have therefore not considered these as I do not believe their derivation has followed the current guidelines. It appears that the Mean Value test has been applied to all samples therefore suggesting that it is the same averaging area. However this does not take into account different geological strata's and includes samples from depths of greater than 1m, which CLEA does not consider that exposure to soils below 1 m depth would not take place. However I understand that any earth works may alter this.**

Status
No information available.

Site History
Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be open ground. The OS plan of 1961 shows the site to still be open ground. The aerial photograph of 1976 shows the building to be present on-site.

Reference to the Ordnance Survey Sheet 9481NE (1987) shows there to be a very large building, over 220m long, of unknown use on-site.

Reference to the Slough Estates Directory for 1977 lists the use on-site to be storage and haulage. Reference to the Directory for 1978 records the use to be storage of electronic equipment. Reference to the Directory for 1981 documents the use to be storage and haulage. The Directories show this use to remain on-site through to 1999.No use is given on the GIS system in 2002.

Site History
Reference to the Ordnance Survey Sheets 9481NE (1955 & 1961) shows the site to be open ground. The edition of 1971 shows there to be a building on-site subdivided into two units, Refs 316 & 317. Both units are given to be a Motor Car Assembly Works.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

The Slough Trade Directory for 1969 listed JW Automotive Engineers, motor car engineers, to be present on-site. Reference to the Slough Estates Directory for 1977 lists there to be a company processing motion picture films on-site. The Directories show this use to be on-site through to 1992.

Reference to the Ordnance Survey Sheet 9481NE (1994) and Plotos (OS) Mapping Service (1998) shows the building to remain on-site, though no use is given.

Additional Information
Bucks Film Labs Ltd had a trade waste discharge schedule for the site from at least 1977 to 1986 for Waste and rinse waters resulting from photographic film processing.

Site Investigation
No information available.

Remediation Status
No information available.

Site History
Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be the buildings of Cockfield Farm.

Reference to the Slough Estates Directory for 1970 lists there to be two uses listed as present on-site: letterpress and lithographic printers; and air operated pumps & systems. Reference to the Directory for 1977 lists the printers to have been replaced by a designers of racing cars. Reference to the Directory for 1978 lists the pumps systems works to have been replaced by a hot press marking machine mfrs. Reference to the Directory for 1981 lists the hot press mfrs to have been replaced by a mfrs of light machinery and plastic goods. Reference to the Directory for 1988 shows the racing car designers to have been replaced by a non-destructive test instrumentation works.

Reference to the Ordnance Survey Sheet 9481NE (1994) and Plotos (OS) Mapping Service (1998) shows the building to remain on-site, with no subdivision into two units, though no use is given. No occupier is listed in 2002 on the GIS system.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

Site History
Reference to the County Series Edition of 1924 map shows there to be a very large building of unknown use on-site. Reference to 'The Slough Estates Railway' reveals the building, 'Building No 3', to have originally been used for the reconstitution of crippled war vehicles. The building was leased in the early 1920s to a car manufacturer. In 1932 the northern half of the building was leased to a sweet and confectionery manufacturer. This is confirmed by the County Series Edition of 1932 map.

During the Second World War the car manufacturer switched production to components for the Churchill Tank. The confectionery company was permitted by the War Office to continue to produce its chocolate bars at reduced levels in order to supply the armed forces. Part of the factory though was given over to other processes for the war effort, including canning of bacon and a motor cycle assembly and repair operation.

The building has continued to be leased by the sweet and confectionery manufacturer from that time up to present day, as confirmed by the Slough Estates Directories and local knowledge. The Slough Estate Directories show that the car manufacturer moved away from the site between 1970 and 1974.

Reference to the Ordnance Survey Sheet 9581NW (1956) shows there to be two new buildings erected at the northern end of the original building at 495170 181570 and 495050 181610. These are part of the confectionery works. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) shows there to be a car park for employees to the north of the original site. Reference to the Clyde Surveys aerial photograph (13/6/81. 1:12,000. Run 4 3.120) shows there to be another building on-site at 495040 181720 as part of the car park.

Reference to the Plotos (Ordnance Survey) Mapping Service (1998) shows the site to be unchanged.

Additional Information

Status
redeveloped between 1986 and 1991, probably circa 1989.

Site History
Reference to the County Series Edition of 1932 shows the site to be vacant land. Reference to the Ordnance Survey Sheet 9481NE (1955) shows there to be a paint and varnish works on-site. The OS plan of 1962 shows the site to be marked as a works. On the 1971 plan the original building at the grid ref 494860 181675 is marked as a warehouse. To the east of the original building (804/5 Oxford Avenue) a new building is shown, labelled as a Paint Works. This was 806 Oxford Avenue (grid ref 494715 181670).

Reference to the Ordnance Survey Sheet 9481NE (1987) shows the site to be unchanged, though no uses are given for either building.

Reference to the Ordnance Survey Sheet 9481NE (1994) shows the buildings to have gone. The site is now covered by one building of unknown use (804-806 Oxford Avenue, central grid ref 494690 181670). The aerial photographs show this redevelopment to have occurred between 1986 and 1991.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
Reference to the Plotos (Ordnance Survey) Mapping Service (1998) show the site to be unchanged, though no use is given. Reference to the J.A. Storey and Partners aerial photograph (7/10/86. 1:10,000. Run 4 097) shows the original buildings to remain. Reference to the Aerofilms aerial photo (19/8/91. 1:10,000. Run 4 0757) shows the new building to be present on-site. Reference to the Slough Estate Directories list there to be a publisher of children's book and a printers and designers on-site at 806 Oxford Avenue. The printers is present to 1978. A general machining engineers and a manufacturer of pressure diecasting machines is listed at 804/5 Oxford Avenue from 1978 to 1982. From 1989 three uses are listed for the site: a sales promotion consultancy and marketing company; a photographic equipment wholesaler; and an electrical accessories supplier (from 1991). The marketing company is replaced in 1993 by a telemarketing company, present to 1996. The photographic company is present through to 1999, though its use changes to a digital photography, website design and multi-media design company in 1999. The electrical accessories supplier is present to 1997 with the site being listed in 1998 and 1999 as in use by a software duplication company. In 2002 the GIS system lists the following occupiers on-site: Mike O´Neill Associates at 805; Protake Ltd at 804; and Lynic Technology Plc at 806. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** No information available.								
306	**708-709 Banbury Avenue**	**M**	**Private domestic dwellg - grdn - 50-250m**	**Metal manufacturing: Iron and steelworks**	**Foundry**	**1**	**3100**	**494977, 181666**
Status No information available. **Site History** Reference to the Kelly's Directory for Buckinghamshire of 1938 records there to be a foundry specialising in gunmetal, phosphor bronze and aluminium castings. Salt Hill Foundry Co (iron founders/ castings) is listed at 37 Dundee Road from 1928 to 1957. The foundry building is off Dundee Road a short distance from the Cockfield Farm buildings. Reference to the Ordnance Survey Sheet 9481NE (1955) confirms there to be a foundry on-site. The 1962 OS plan shows both the foundry and the farm buildings to have been cleared. An annotated 1962 plan has the current Banbury AV units drawn on. Reference to the Slough Estates Directory for 1977 illustrates that the foundry has gone, and the present building to be in place. One of the units has a used listed at this time:								

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

mfrs of packaging.

Reference to the Directory for 1979 lists the packaging mfrs to have been replaced by a commercial printers and stationers.

Reference to the Directory for 1987 lists the printers to have gone and been replaced by a light engineers, that also occupies a unit in the neighbouring building (Ref 320).

Reference to the Directory for 1988 lists the other unit of this site to be in use as an assembly, repair and storage workshop of a small computer systems firm.

Reference to the Directory for 1992 lists this workshop to have been replaced by a mainframe computer engineers.

Reference to the Ordnance Survey Sheet 9481NE (1994) and Plotos (OS) Mapping Service (1998) shows the building, with two units on-site, to remain, though no use is given. In 2002 the GIS system lists Excel Engineering to be the site occupiers at 708-710 Banbury Avenue (I.e. including Ref 320 to the west).

Site History
Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be open ground, with a small contained yard on the east of the site. No use is given to this yard. After the OS plan of 1962, a building is constructed on-site subdivided into two units.

Reference to the Slough Estates Directory for 1970 lists one of the units to be in use by an industrial safety equipment company. No usage information is listed for the other unit. Reference to the Directory for 1974 lists the buildings to both be in use by the industrial safety equipment company.

Reference to the Directory for 1977 records the units to be under separate uses. The unit in which the safety equipment company originated retains that use. The other unit is now a mfrs of printing inks.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
Reference to the Directory for 1982 shows the industrial safety equipment company to have been replaced assembly, alteration, testing and repair of retail shop fittings. Reference to the Directory for 1986 lists the use to be a computer systems company for the publishing industry. Reference to the Directory for 1980 shows the printing ink mfrs to have been replaced by a light industrial fabrication works. Reference to the Directory for 1984 lists the use to now be steel fabrication. Reference to the Ordnance Survey Sheet 9481NE (1987) shows there to be two buildings of unknown use on-site. Reference to the Ordnance Survey Sheet 9481NE (1994) and Plotos (OS) Mapping Service (1998) shows the building to remain on-site, though again no use is given. No uses are given on the GIS system in 2002. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** No information available.								
314	**717 Banbury Avenue**	**L**	**Private domestic dwellg - grdn - 50-250m**	**Factory or works - use not specified**	**Works use unmarked**	**1**	**1270**	**494792, 181721**
Status The site covers both Refs 314 & 315. **Site History** Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be open ground. After the OS plan of 1962 a building is developed on-site, subdivided into two units. Reference to the Slough Estates Directory for 1970 lists one of the units on-site to be in use as a light engineers. No usage information is listed for the other unit. Reference to the Directory for 1974 lists the units to both be in use by a hot press marking machine mfrs. Reference to the Directories show the hot press mfrs to remain present in both units through to 1991. In 1992 the mfrs remains only in the unit, not previously a light engineers. This is listed as present through to 1999. Reference to the Ordnance Survey Sheet 9481NE (1994) and Plotos (OS) Mapping Service (1998) shows the building to remain on-site, though again no use is given. In 2002 the GIS system lists the following occupiers to be present: Peme Ltd at 716; and PBE Marketing Systems Ltd at 717.

Status
The original building from 1960s remains on-site.

Site History
Reference to the Ordnance Survey Sheets 9481NE (1955 & 1961) show the site to be open ground. The edition of 1971 shows there to be a building on-site subdivided into two units, Refs 316 & 317. Both units are given to be a Motor Car Assembly Works.

Reference to the Slough Estates Directory for 1974 lists the unit to be in use for the production of press tools. Reference to the Directory for 1977 lists this to have been replaced by a manufacturer and assembler of gas industry components. Reference to the Directory for 1982 records the unit to be a precision engineers specialising in steel fabrication and sheet metal works. Reference to the Directory for 1988 lists the unit to be a light industrial research and development company. Reference to the Directory for 1995 lists the unit to be a manufacturer, service and distribution of industrial textile, belting and ancillary products.

Reference to the Plotos (OS) Mapping Service (1998) shows the building to remain on-site, though no use is given. In 2002 GIS lists Leder Beltech (UK) Ltd to be present at 715 Banbury Av.

Site History
Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be open occupied by an outbuilding of the Cockfield Farm.

Reference to the Slough Estates Directory for 1978 lists there to be a shock absorber and control panel works on-site. The aerial photograph of 1976 shows the building subdivided into two units to be present on-site, Refs 320 & 319.

Reference to the Directory for 1987 lists the works to have been replaced by a light engineering company, that is also occupying the neighbouring unit at this time (Ref 321).

Reference to the Ordnance Survey Sheet 9481NE (1994) and Plotos (OS) Mapping Service (1998) shows the building to remain on-site, though again no use is given. In 2002 the GIS system lists Excel Engineering to be the occupier at 708-710 Banbury Avenue (I.e. including the Ref 306 neighbouring to the east).

Status
This is building was no 1 of Slough Trading Estate, old government wool store building, subdivided into 13 uses now, incl. new zipper co (active petroleum site) and several disused tanks records.

Site History
Reference to the County Series Edition of 1924 identified a building on-site of unknown use. According to the 'The Slough Estates Railway' the building, 'Building No 1', was utilised at this time as a Government Wool Store.

Reference to 'The Slough Estates Railway' and the County Series map Edition of 1932 shows the site to have been subdivided into four units: a stone/ quarrying company; a battery manufacturers; a steel reinforcing company; and a scrap metal merchant (tin, lead, solder and metal merchants and domestic mincing machines).

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

Reference to the Kelly's Trade Directory for Buckinghamshire for 1938 reveals the building to have been already further subdivided. Bay 1 was leased to a paint and varnish manufacturer (George Bros. (paints) Ltd through until 1957. Bay 13 was leased to a company manufacturing white lead and performing heat treatment of steels (metal Colours (Slough) Ltd). This use remained present through to 1984.

Reference to the Kelly's Trade Directory for Buckinghamshire for 1940 records Bay 9 to be in use by an electrical wire insulation company. This use was present through to 1970. Reference to the Kelly's Trade Directory for Slough of 1954 lists Bay 10 to be a handbag frame and general engineers (1950-1957). This use was gone by the Slough Estates Directory of 1970. Bay 8 was documented to be a general engineers, present through to 1977 (Benfix Steel Co Ltd).

Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to have indeed been subdivided into 13 units. These were in use as an electrical works, an insulation works, a warehouse, two transport depots, a battery works, three engineering works, a diecasting and metal works and a steel heat treatment works.

Reference to the Slough Estates Directory for 1974 lists the transport depots to now be electrical wire works.

Reference to the Ordnance Survey Sheet 9481NE (1987 and 1994) shows no uses to be marked for the site. The site continues to be subdivided into the 11 units.

The Slough Estate Directories (telephone) list the following uses over time: Bay 1 & 2 1978/9 Sheet metal works & ventilation engineers; Bay 1 1980 newspaper publication; Bay 2 1980 Manufacturerr of printing inks (Present to 1999); Bay 3 1996/7 Warehousing; Bay 4 1974 Manufacturer of veneers (present to 1988); Bay 6 1989 Wood & polyester veneer products manufacturer; Bay 7 1978 Bright steel stockists (present to 1991); 1992 General engineers & steel stockists (present to 1999); Bay 8 1988/9 Processing of pictures, films & video tapes, 1999 office equipment retailers; Bay 9 1979 HF welding of PVC film (present to 1985), 1986/7 children´s clothing manufacturer; Bay 10 1989 pressure type slide fasteners (present to 1999); Bay 11 & 12 1983 packing, unpacking & processing of boxed merchandise (present to 1986); Bay 11 1989 warehousing & distribution (present to 1992); bay 12 1988 storage & supply of packaging materials (present to 1999); Bay 13 1986 shock absorbers & control panels (present to 1999).

184	Northborough Road Landfill	M	Private domestic dwellg - grdn - 0-50m	Mining & quarrying general	Pit/scar	194	52039	494909, 182107

Status
Former Trading Estate tip, still owned by SEL. Several SI reports done. One by WS Atkins 1990 not present on file anymore. Need to approach SEL re further info and a copy of that report. The eastern end of the landfill sometimes referred to as Fairlie Rd Landfill.

Site History
The majority of the site was formerly a series of gravel pits which were subsequently used as a landfill site, mainly for building and light industrial waste, deposited to a depth of 3 to 6m, through both landfilling and land-raising to between 2-3m above the original ground level to the south. The land was subsequently reinstated with a cap of approx. 0.7m of clay. The lower lying sections were neither excavated nor included in the landfill site.
The OS CS map edition of 1924 shows a large pit to be present on-site, with railway/ tramway sidings into it.
The map edition of 1932 shows there to be a covered reservoir occupying the northwest extent of the site. The sidings have gone.
On the 1955 OS plan (9482SE) the pit is marked as an old gravel pit.
On the 1962 plan the pit is marked as disused.
The Fairey Surveys Ltd aerial photo of 1971 shows the second covered reservoir to be present. The pit scar remains and some infilling is taking place in the east of the pit.
Infilling has only slightly advanced by the 1976 Fairey Surveys Ltd aerial photo.
By the Clyde Surveys Ltd aerial photo of 1981 infilling appears to have ceased, though the site does not appear to have been restored.
On the 1994 edition there is another covered reservoir on the western area of the site.

Additional Information
map of original area - site investigation summary available

The EA summary file for this site has been reviewed. The available information predates the formation of the EA. The EA hold no further information on this site (i.e. no confirmation of filling dates).
The first inspection report is not dated. No surface cracks, no visible waste, no impermeable cap, soil and vegetation cover present. No signs of vegetation stress, no odour, and no gas bubbles evident. Other comments state that the gas tech of the site revealed no gas, and that further spiking would be carried out when the ground is softer.
The second inspection was carried out on 14/11/94 using a GA infra-red analyser, serial no. 3795. Conditions recorded as 14 degrees centigrade, wet ground, warm and raining. Six gas spikes done, but no methane detected (Carbon dioxide not measured); spike 1 at 495020 182145, spike 2 at 494995 182145, spike 3 at 494935 182105, spike 4 at 494995 182070, spike 5 at 495 060 182060 and spike 6 at 495130 182060.

Site History
Reference to the County Series Edition of 1924 shows the site to be vacant land. Reference to the County Series Edition of 1932 shows there to be a building of unknown use on-site.

Reference to the OS sheet 9581NW (1956) shows building to be marked as a cannery (123 Edinburgh Avenue). The OS plan of 1961 shows site to be marked as a works. On the 1968 OS plan the site is given as a engineering works. The works has been extended eastwards.

Reference to the Ordnance Survey Sheet 9581NW (1987) shows the building to remain though no use is given. The extension is listed as 126 Edinburgh Avenue.

Reference to the Ordnance Survey Sheet 9581NW (1994) shows the building to remain unchanged, though no again uses are given. Between the aerial photo of 1996 and the GIS of 2002 shows the site to have been redeveloped to a large building stretching north along Fairlie Road (Ref 392).

Reference to the Slough Estates Directory for 1989 lists 126 Edinburgh Avenue, the extended part of the building on-site, to be an exhibition and conference display suppliers. This use is listed as on-site through to 1997. No information is available as to the use of the original part of the building.

Additional Information
A request for information under Section 19 of the EPA dated Jan 1992 was addressed to Slough Exhibition Co Ltd at 126 Edinburgh Ave. The request was made to ascertain whether or not the site needed a Part B authorisation (Wood and Metal)

Site History
Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be vacant land. The OS plan of 1962 shows the site to still be open ground. The 1971 OS plan shows there to be a depository on-site. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) confirms the building to be present.

Reference to the Ordnance Survey Sheet 9481NE (1987) shows the site to be unchanged. Reference to the Aerofilms aerial photograph (19/8/91. 1:10,000. Run 4 0757) shows the building to remain on-site. Reference to the Ordnance Survey Sheet 9481NE (1994) shows the building to remain. Reference to the Aerofilms aerial photo (15/5/96. 1:10,000. Run 4 7872) shows the building to have gone. The site is now a yard/ parking area to the new building to the south of the site (see Refs 287 and 288).

Reference to the Plotos (Ordnance Survey) Mapping Service (1998) shows the site to be unchanged.

Reference to the Slough Estate Directories lists 799 Weston Road, the assumed address of the site, to be a furniture warehouse in 1970 and 1974. The Directory for 1982 records the site to be in use by a computer services company. This use is present to 1984. From 1985 through to 1988 energy consultants are documented to be on-site.

Site History
Reference to the County Series Edition of 1932 shows the site to be vacant land.

Reference to the OS sheet 9581NW (1956) shows there to be a sheet metal works (495240 181655), an engineering works (495255 181630) and a cooperage (495240 181680) on-site. There are also ten very small units of unknown use on-site as out buildings addressed as units 1—11. On the 1961 OS plan the cooperage, sheet metal works and eng works are all given to be works. The outbuildings, with the exception of units 10 & 11 (495295 181625), have gone. The 1968 plan gives the former sheet metal works and eng works to both be eng works. No use is given for the former cooperage.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) shows the cooperage to have gone. This part of the site is vacant land behind the sheet metal works. The sheet metal works building has extended east. The photo also shows there to be a new building at 495275 181720 (Ref 407). No use is given for this building on the 1987 OS plan. Reference to the Ordnance Survey Sheet 9581NW (1987) shows the site to be unchanged, though no uses are given to the former sheet metal works (124a Edinburgh Avenue) and engineering works (123a Edinburgh Avenue). Reference to the Ordnance Survey Sheet 9581NW (1994) shows the site to be unchanged. Between the 1996 aerial photograph and the 2002 GIS layout the former sheet metal works, eng works and new works use unmarked at 495275 181720 have gone. A large building, labelled 126Fairlie Road has been built across the whole site, including across the former area of ref 206 (Works UU) on the corner with Edinburgh Av. Reference to the Slough Estates Directory for 1989 lists 124 Edinburgh Avenue to be a manufacturer of electric furnaces and a sheet metal works. This use is listed through to 1981 and then again from 1986 to 1988. Reference to the Directory for 1993 lists 123a Edinburgh Avenue (the building of the former engineering works) to be an engineers involved in design and project management, process equipment and stainless steel. This use is listed through to 1997. Trade Directories of Slough list 132-3 Fairlie Road to be a clothing warehouse & distributors in 1989 - this is thought to correspond to the new Works UU at 495275 181720. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** No information available.

Site History
Reference to the County Series Second Edition of 1899 shows the site to be vacant land.

Reference to the County Series Edition of 1924 shows there to be an ice factory on-site beside Dundee Road. Reference to 'The Slough Estates Railway' (1989) records the factory to have originally been the building where vehicles at 'The Depot' (the Estate's original use) were washed down before repair work on the ex-military vehicles commenced. The building had no mains water supply. All water requirements were met by a steel lined 1,000ft deep artesian well. This source also records part of the factory to have been used to produce sand bags for the Estate during WW2. The rest of the site to the west of the ice factory has sidings on it and a lorry ramp where goods could be loaded and unloaded from the trains onto trucks. Reference to the County Series Edition of 1932 shows the site to be unchanged.

Reference to the Ordnance Survey Sheet 9481NE (1955) shows the ice factory to remain. The area of the sidings is now covered by a plastic mouldings factory and a building of unknown use (shown to be subdivided into two units) (both Ref 330) and a plastic works (Ref 331). The north of the site, along Oxford Avenue, is covered by a magnetic recording tape factory and an adjoining building of unknown use (both Ref 303), a metal containers works (Ref 304) and a paint works (Ref 305). Reference to the Kelly's Trade Directory for Slough of 1954 lists the paint works to be involved in the manufacture of cellulose and enamel paints.

Reference to the Ordnance Survey Sheet 9481SE (1982) shows ice factory to now be marked as a cold store. This map also shows the plastic mouldings factory and plastic works to have gone. This part of the site is now covered by one large building of unknown use (Ref 357). It is probable that the actual factory and plastic works buildings remain and that the gaps between them have been infilled by more units. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) shows this building/ expansion to be present by 1971.Reference to 'The Slough Estates Railway' (1989) records that the cold store building was demolished in 1986.

Reference to the Ordnance Survey Sheet 9481SE (1982) shows the magnetic recording tape factory to now be a works, the metal containers works to be a warehouse and the

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

paint works to be a works. Theses building overlap onto this map sheet from Ordnance Survey Sheet 9481NE.

Reference to the Ordnance Survey Sheet 9481NE (1987) shows works (previously magnetic recording tape factory), warehouse (previous metal container works) and the works (previously paint works) to have gone. This part of the site is now vacant land. Reference to the J.A. Storey and Partners aerial photograph (7/10/86. 1:10,000. Run 4 097) shows the entire site to be vacant land.

Reference to the Aerofilms aerial photograph (19/8/91. 1:10,000. Run 4 0757) shows there to be a new building of unknown use on-site. This building extends between Oxford Avenue and Buckingham Avenue (Ref 328).

Reference to the Ordnance Survey Sheet 9481NE (1994) and the Plotos (Ordnance Survey) Mapping Service (1998) show the site to be unchanged.

Reference to the Slough Estate Directories provides no information as to the use of the original buildings on the site over time as no addresses are known for these and no probable/ likely addresses on Oxford Avenue are listed.

The new building on-site is addressed as 351 Buckingham Avenue/ 351 Oxford Avenue on the Plotos (Ordnance Survey) Mapping Service 1998.

Note: 351 Oxford Avenue is listed as an electrical & electronic contact lubricant works in 1970 & 1974. From 1978 to 1984 351 is listed as a printing & duplicating service. But it is unknown as to what part of the site 351 was at that time.

Site History
Reference to the County Series Edition of 1932 shows the site to be vacant land. Reference to the Ordnance Survey Sheet 9481NE (1955) shows there to be an insulated wire factory, an electrical works and a two buildings on Buckingham Avenue of unknown use (Ref 329).

Reference to the Ordnance Survey Sheet 9481SE (1982) shows the works of unknown use to now be marked as a warehouse and a factory (Refs 355 and 356). This map also shows there to be a factory marked on-site on Buckingham Avenue at 494715 181490. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) shows this building to be present by 1971.

Reference to the Ordnance Survey Sheet 9481NE (1987) shows there to be a building of unknown use between the insulated wire factory and the electrical works (now with no uses marked) on Oxford Avenue on the north of the site (Ref 323) at 494765 181545. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) shows this building to be present by 1971.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

Reference to the J.A. Storey and Partners aerial photograph (7/10/86. 1:10,000. Run 4 097) shows the buildings to remain unchanged. Reference to the Aerofilms aerial photograph (19/8/91. 1:10,000. Run 4 0757) shows the buildings to have gone. The site is now covered by a new building of unknown use that extends between Oxford Avenue and Buckingham Avenue (Ref 327). The extreme west of the site is vacant land.

Reference to the Ordnance Survey Sheet 9481NE (1994) and the Plotos (Ordnance Survey) Mapping Service (1998) show the site to be unchanged.

Reference to the Slough Estate Directories provides no information as to the use of the original buildings on the site over time as no addresses are known for these and no probable/ likely addresses on Oxford Avenue are listed.

The new building on-site is addressed as 352 Buckingham Avenue on the Plotos (Ordnance Survey) Mapping Service 1998. The Directories list this address to be in use by a medical systems company from 1989 through to 1999.

Status No information available. **Site History** Reference to the County Series Edition of 1932 shows the site to be vacant land. Reference to the Ordnance Survey Sheet 9481NE (1955) shows there to be a general engineering works (4945365 181715) and a fire protection apparatus works (494550 181690) on-site. The latter is recorded as present in the Kelly's Trade Directory of Slough of 1954. To the south of the fire protection apparatus works is a mirror image building for which no use is marked (796 Weston Road). The 1962 OS plan shows the former eng works to be marked as a works. The fire protection works together with the mirror image building is marked as another works. The OS plan of 1971 shows there to be an additional building given as an engineering works to the north of the other former eng works at grid ref 494570 181740. The former eng works is again marked as an engineering works. The former fire protection works is marked as foundry, while its mirror image building to the south is given to be an engineering works. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) shows confirms the presence of the new building at 494570 181740. Reference to the Ordnance Survey Sheet 9481NE (1987) shows the site to be unchanged, though no use is given.

Reference to the Aerofilms aerial photograph (19/8/91. 1:10,000. Run 4 0757) shows the buildings to remain on-site. Reference to the Ordnance Survey Sheet 9481NE (1994) shows the buildings to remain. Reference to the Aerofilms aerial photo (15/5/96. 1:10,000. Run 4 7872) shows the buildings to have gone. The site is now covered by a new large building of unknown use (794-9 Weston Road). This new building covers the former areas of Refs 289, 290 & 307, a safety glass works, a metal engravers and a depository respectively. Reference to the Plotos (Ordnance Survey) Mapping Service (1998) show the site to be unchanged. Reference to the Slough Estates Directories list there to be a building and civil engineers at 796 Weston Road from 1991 to 1994. The Directory for 1970 lists there to be a diemakers (present to 1974) and a ferrous castings foundry on-site at 797 Weston Road. The foundry is listed as present through to 1991. A general engineers is listed at 798 Weston Road from 1970 through to 1979. The engineers also manufacturers carburettors and pressure diecasters. The building identified on the 1971 aerial photograph is assumed to be 798A Weston Road. This address is listed in the Directories to be a distributor of pneumatic nailing and stapling tools from 1970 through to 1983. From 1985 to 1989 there is a computer services company recorded as present at 798A Weston Road. From 1996 the new building on-site (addressed as 962 Weston Road in the map provided with the Directories) is listed as a wholesale cash and carry through to 1999. No details are listed about the site occupier on the GIS system in 2002. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** No information available.

From former IPC files: The only fuel that is stored on these premises is 30 sec Gas Oil. It is contained in a 3,000 gallon above ground tank constructed of mild steel and painted on the outside. It is mounted on a concrete base and surrounded by a 5? high brick wall. It is situated outside the main wall on the west side of the building.

Surecast produce non-ferrous (not iron or steel) metal castings using the sand casting method. Most of the plant and equipment was installed on these premises in 1980, when the foundry moved here. In 1986 with the purchase of another foundry, some new and replacement plant was installed.

Wooden pattern are made to the customer?s engineering drawings, stored on the premises, and used to produce identical components to customers future orders. All production is done on a batch production basis.

Cores, where necessary, produce the internal form of some castings, and are the first things to be manufactured. They are produced by one of three processes: hard sand core making; shell core making and CO2 core making. Hard sand and shell cores are produced using the same method as their moulding processes.

In the CO2 core process sand from the hopper is introduced by gravity into a mixer and combined with resins. The mix is manually inserted into a wooden core mould to produce the form of the core, and CO2 is then passed through the sand resin mix which acts as a catalyst binding the sand and the resin together. Cores are not reused as they are destroyed during the moulding process, and the residue is removed during the knock-out process.

Moulds are then made by one of three processes: the Green sand process; shell sand process; or the hard sand process. Moulds consist of two halves, a top and a bottom into which any core is placed. The green sand process consists of damp ?green sand? being compressed onto a wooden pattern contained in a metal moulding box. The compression is achieved either manually using a series of tools, or alternatively by machines known as rollovers or pin-lifts. The process produces two halves into which any of the three types of cores may be placed. The green sand used in this process is all recycled.

Shell moulding is a process whereby a mould or core is formed by hardening pre-resinated sand within a heated metal pattern. The patterns are mounted onto a ?shell machine? where they are heated by means of gas. When they have reached the required temp the patterns are inverted, and sand is introduced into the pattern by gravity. The sand heats up, and the resin bonds it to a hard mould or core. The resinated sand cannot be recycled and is thus disposed of by an authorised contractor.

Hard sand moulding is a process where chemically bonded sand is poured into a wooden pattern, and an Ester Hardener is passed through the pattern causing a catalytic reaction that hardens the sand to produce a mould or core. This sand cannot be recycled and is thus disposed of by an authorised contractor.

Metal is melted is the metal melting areas (using either all new ingot or mixed load of ingot and clean scrap returns), and carried to the place where the assembled moulds are situated by means of a hand portable ladle. Prior to casting the molten metal undergoes a number of treatments, such as:

Modifying: ?Navac? (metallic sodium) is introduced into the molten aluminium alloy;

De-gassing: reduction of entrapped gas, typically hydrogen, by injecting ?Nitrogen N2 (oxygen free);

Refining: ?Nucleant? refines the grain structure of the metal and is introduced into the metal in tablet form; and

Cleaning: During the casting process, oxides are formed on the surface and introduced into the metal. To remove these products, ?Coveral? is introduced.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference

The molten metal is then poured into the moulds, and the moulds are then left to cool, prior to being broken up and having the sand knocked out of them by means of shock vibration methods in the relevant knockout areas.

Castings are then taken to the relevant fettling are, where unwanted metal is removed. The heavy or large removals of surplus material from a casting is normally done by cutting on a band saw or semi-automatic circular saw. ?Tallow? is used as a lubricant for the cutting surfaces. Only swarf is generated as waste product from this operation. The material is not reused at the foundry and is collected and sold as scrap to a metal reclamation company, Remet Ltd. After having been sawn the castings are then Linished. This is achieved by the use of high speed abrasive belts. Castings are then ?shot-blasted? in a self contained cabinet. After fettling the castings are inspected prior to despatch to the customer.

In June 1993 Surecast decided to dispense with the Shell Equipment and replace it with some more Hard sand Equipment. The layout of the premises was thus altered.

Surecast closed in July 1998.

Site Investigation

297	**810-811 Oxford Avenue**	**M**	**Private domestic dwellg - grdn - 50-250m**	**Engineering Works: Mechanical engineering and ordnance works**	**Eng Works (Electric Tools)**	**139**	**2226**	**494662, 181618**

Status
No information available.

Site History
Reference to the County Series Edition of 1932 shows the site to be vacant land. Reference to the Ordnance Survey Sheet 9481NE (1955) shows there to be an electric tools engineering works on-site. On the 1962 OS plan the site is marked as a works. On the 1971 OS plan the site is given to be an eng works.

Reference to the Ordnance Survey Sheet 9481NE (1987) shows the site to be unchanged, though no use is given. Reference to the Ordnance Survey Sheet 9481NE (1994) and the Plotos (Ordnance Survey) Mapping Service (1998) show the site to be unchanged, though again no use is given.

Reference to the Slough Estate Directories list the site to be a precision engineers on-site from 1985 to 1987. Between 1996 and 1999 the site is documented to be a garage for fleet cars of a main car dealership. In 2002 the GIS system does not have any information on the site occupier.

Status No information available. **Site History** Reference to the Ordnance Survey Sheet 9481NE (1955) shows the site to be vacant land. The 1962 OS plan shows the site to still be vacant land. The 1971 OS plan shows there to be a display stand works on-site. Reference to the Fairey Surveys aerial photograph (May 1971. 1:10,000. Run 31 7.787) confirms the building to be present. Reference to the Ordnance Survey Sheet 9481NE (1987) shows the site to be unchanged. Reference to the Ordnance Survey Sheet 9481NE (1994) and the Plotos (Ordnance Survey) Mapping Service (1998) show the site to be unchanged, though again no use is given. Reference to the Slough Estate Directories list there to be a display manufacturers and a point of sale company specialising in wood and mechanised silk screen prints on-site in 1970. These uses are replaced in 1978 by an electrical accessories and fluorescent accessories manufacturers. Both of these uses are present to 1988. From 1989 the site is recorded to be a manufacturer of automatic and aluminium doors through to 1997. In the Directory for 1999 the site is documented to be a light electronic and small parts mechanical engineers. In 2002 the GIS system lists the occupier as Dars Engineering & Manufacturing Ltd. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** No information available.								

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
59	918-923 Yeovil Road	L	Private domestic dwellg - grdn - 0-50m	Depot (miscellaneous)	Depot	217	1062	494519, 181803

Status
The site was redeveloped to Yeovil Enterprise Centre, now correlates to yard and buildings of 918-923 Yeovil Road.

Site History
Reference to the Ordnance Survey Sheet 9481NW (1955) shows the site to be open ground. Reference to the Ordnance Survey Sheet 9481NW(1971) shows there to be a depot on-site. Reference to the Slough Directories for 1970 lists the site to be a wholesale distributors. Reference to the Directory for 1974 records the site to be in use by distributors of building materials.

Reference to the Directory for 1979 documents the site to be a welding and fabricating specialists. The Directories list this use to be present on-site through to 1996. Reference to the Ordnance Survey Sheet 9481NW (1994) and the Plotos (Ordnance Survey) Mapping Service (1998) show the building to remain unchanged, though no use is given.

Since 1996/8 the site has been redeveloped to part of Yeovil Enterprise Centre, specifically buildings 918 to 923. Interface Systems Inc listed at 922, Plaspak (UK) Ltd listed at 921, Unlock Office Interiors listed at 920, and Top High UK Ltd listed at 918.

Additional Information
No information available.

Site Investigation

Remediation Status
No information available.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
167	PCL0599	L	Indl or factory buildg - vented - on site	Textile works and dye works	Jam Factory	238	6282	495226, 181494

Status
The site was redeveloped in early 2000s, site investigations done (see below) this site is the 6 Edinburgh Ave Fibre Fuel Ltd A16 Physical Treatment Facility. The licence was issued in September 2001. Licence no FIB003. The Fibre Fuel Plant was transferred here in 2002 from Sykes Road

Site History
Reference to 'The Slough Estates Railway' (1989) identified there to be a building on-site. The building, 'Building No 6', was at that time used as a vehicle machine shop.

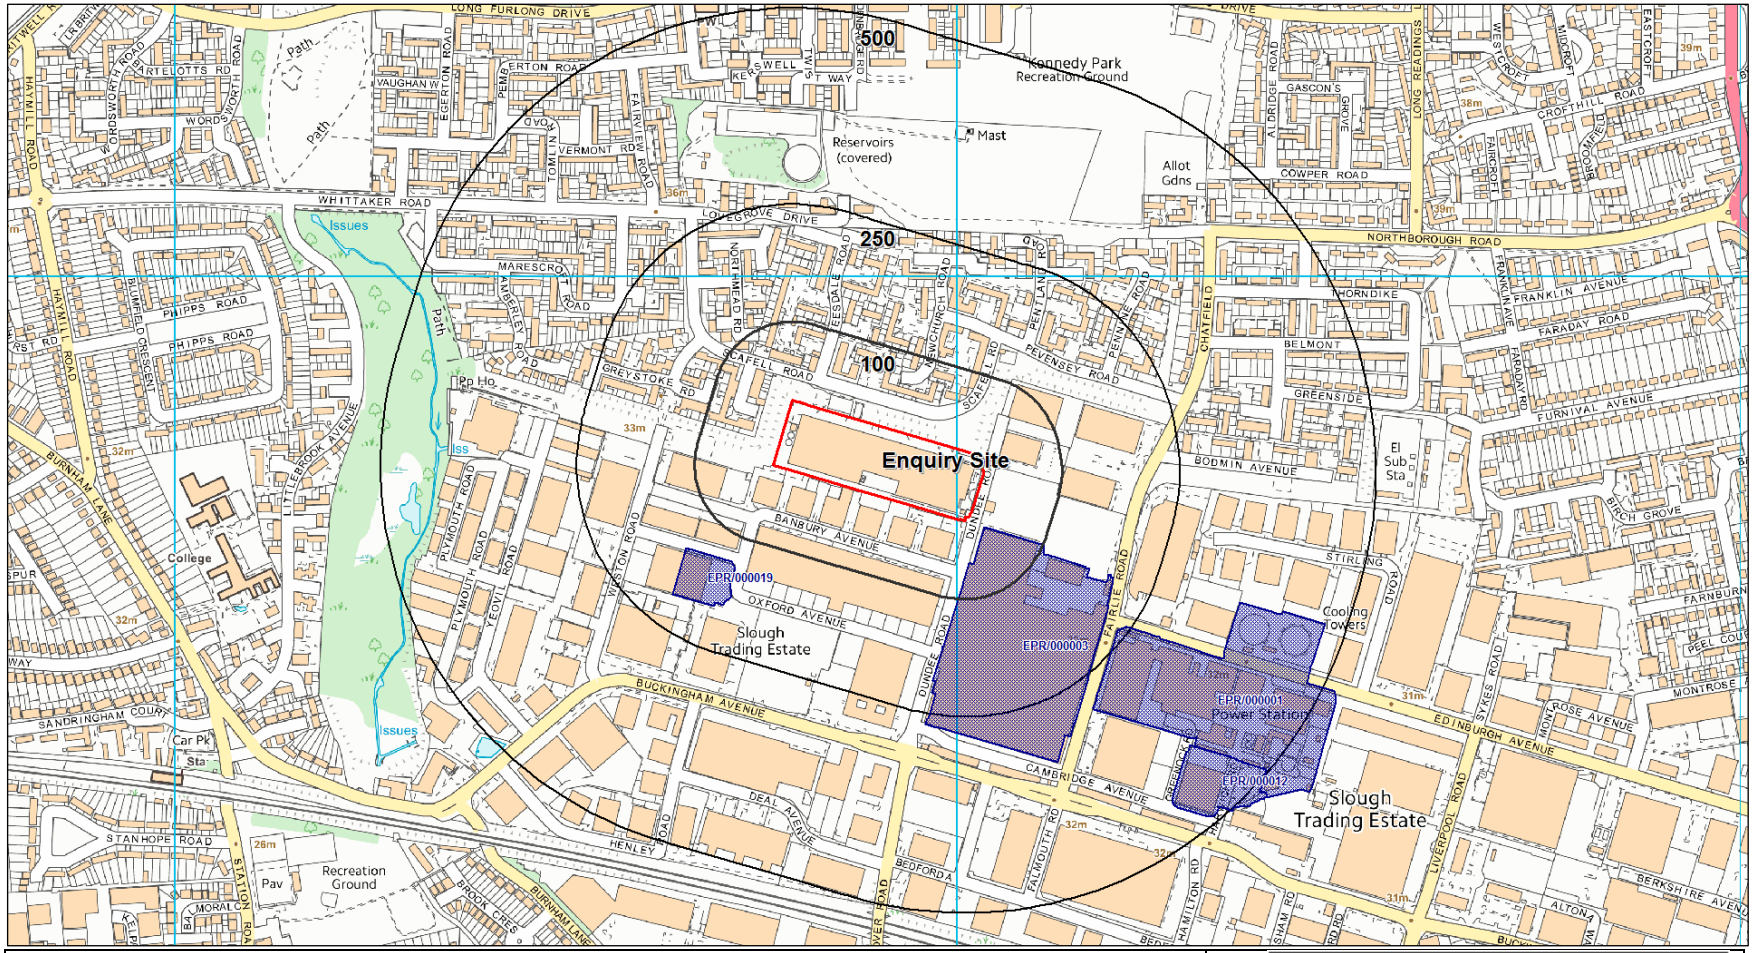

Reference to the County Series Edition of 1924 map shows the building to have been leased out and in use as a jam factory.

Reference to the County Series Edition of 1932 map shows the building to have been leased to a surgical dressings manufacturer.

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
Reference to the Kelly's Directory for Buckinghamshire for 1940 lists part of the building to be leased to a hosiery manufacturer, Grouts (Hosiery) Ltd. Grouts were present to at least 1957, when Marchioness Hosiery Ltd were also listed at the site. Reference to the Ordnance Survey Sheet 9481NE (1955) shows the building on-site to have been subdivided into 2 units: a hosiery works (northern unit); and an engineering works (southern unit). Reference to subsequent map resources of 1987 and 1994, no use information is provided. The Slough Estate's Directory of 1985 lists the unit of the former hosiery works to be occupied by a manufacturer of machinery. In 1992, the Directory gives three uses for the unit, suggesting further subdivision: property maintenance; storage and distribution of plastic; and electrical contractors. Reference to the 1991 Aerofilms aerial photograph shows the building to remain on-site. On the 1996 Aerofilms aerial photo, however, the site is vacant land with the building having been demolished. It is unclear from the GIS in 2002 but it appears that something has been built on-site but no occupier details are given and it is unclear whether the redevelopment represents a yard or a building. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** The results of the contamination analyses have not indicated the presence of significant contamination.

Status No information available. **Site History** Reference to the Ordnance Survey Sheet 9581NW (1987) shows the site to be open ground. Reference to the Ordnance Survey Sheet 9581NW (1994) shows there to be a building of unknown use on-site. Reference to the Aerofilms aerial photograph (19/8/91. 1:10,000. Run 4 0757) shows there to be a building present on-site. Reference to the Plotos (OS) Mapping Service (1998) shows the building to remain on-site, though no use is given. Reference to the Slough Estates Directory for 1989 records there to be a wholesalers and importers of goods for garage forecourt shops on-site. This is replaced in 1993 and 1994 by a general wholesaler and distributor. The Directory for 1996 lists there to be a stockholders and processors of stainless steel, aluminium, copper and brass on-site. This use is								

ID	Site Name	Ranking	Current Use	Contaminative Use	Use Details	Approx. distance (m)	Approx. Area (m2)	Grid Reference
recorded to be present through to 1999. On the 2002 GIS system AALCO is listed as the site occupier. **Additional Information** No information available. **Site Investigation** No information available. **Remediation Status** No information available.

Appendix C Hazardous Substances

Environmental Permit Application

A.1 Relevant Hazardous Substances Assessment

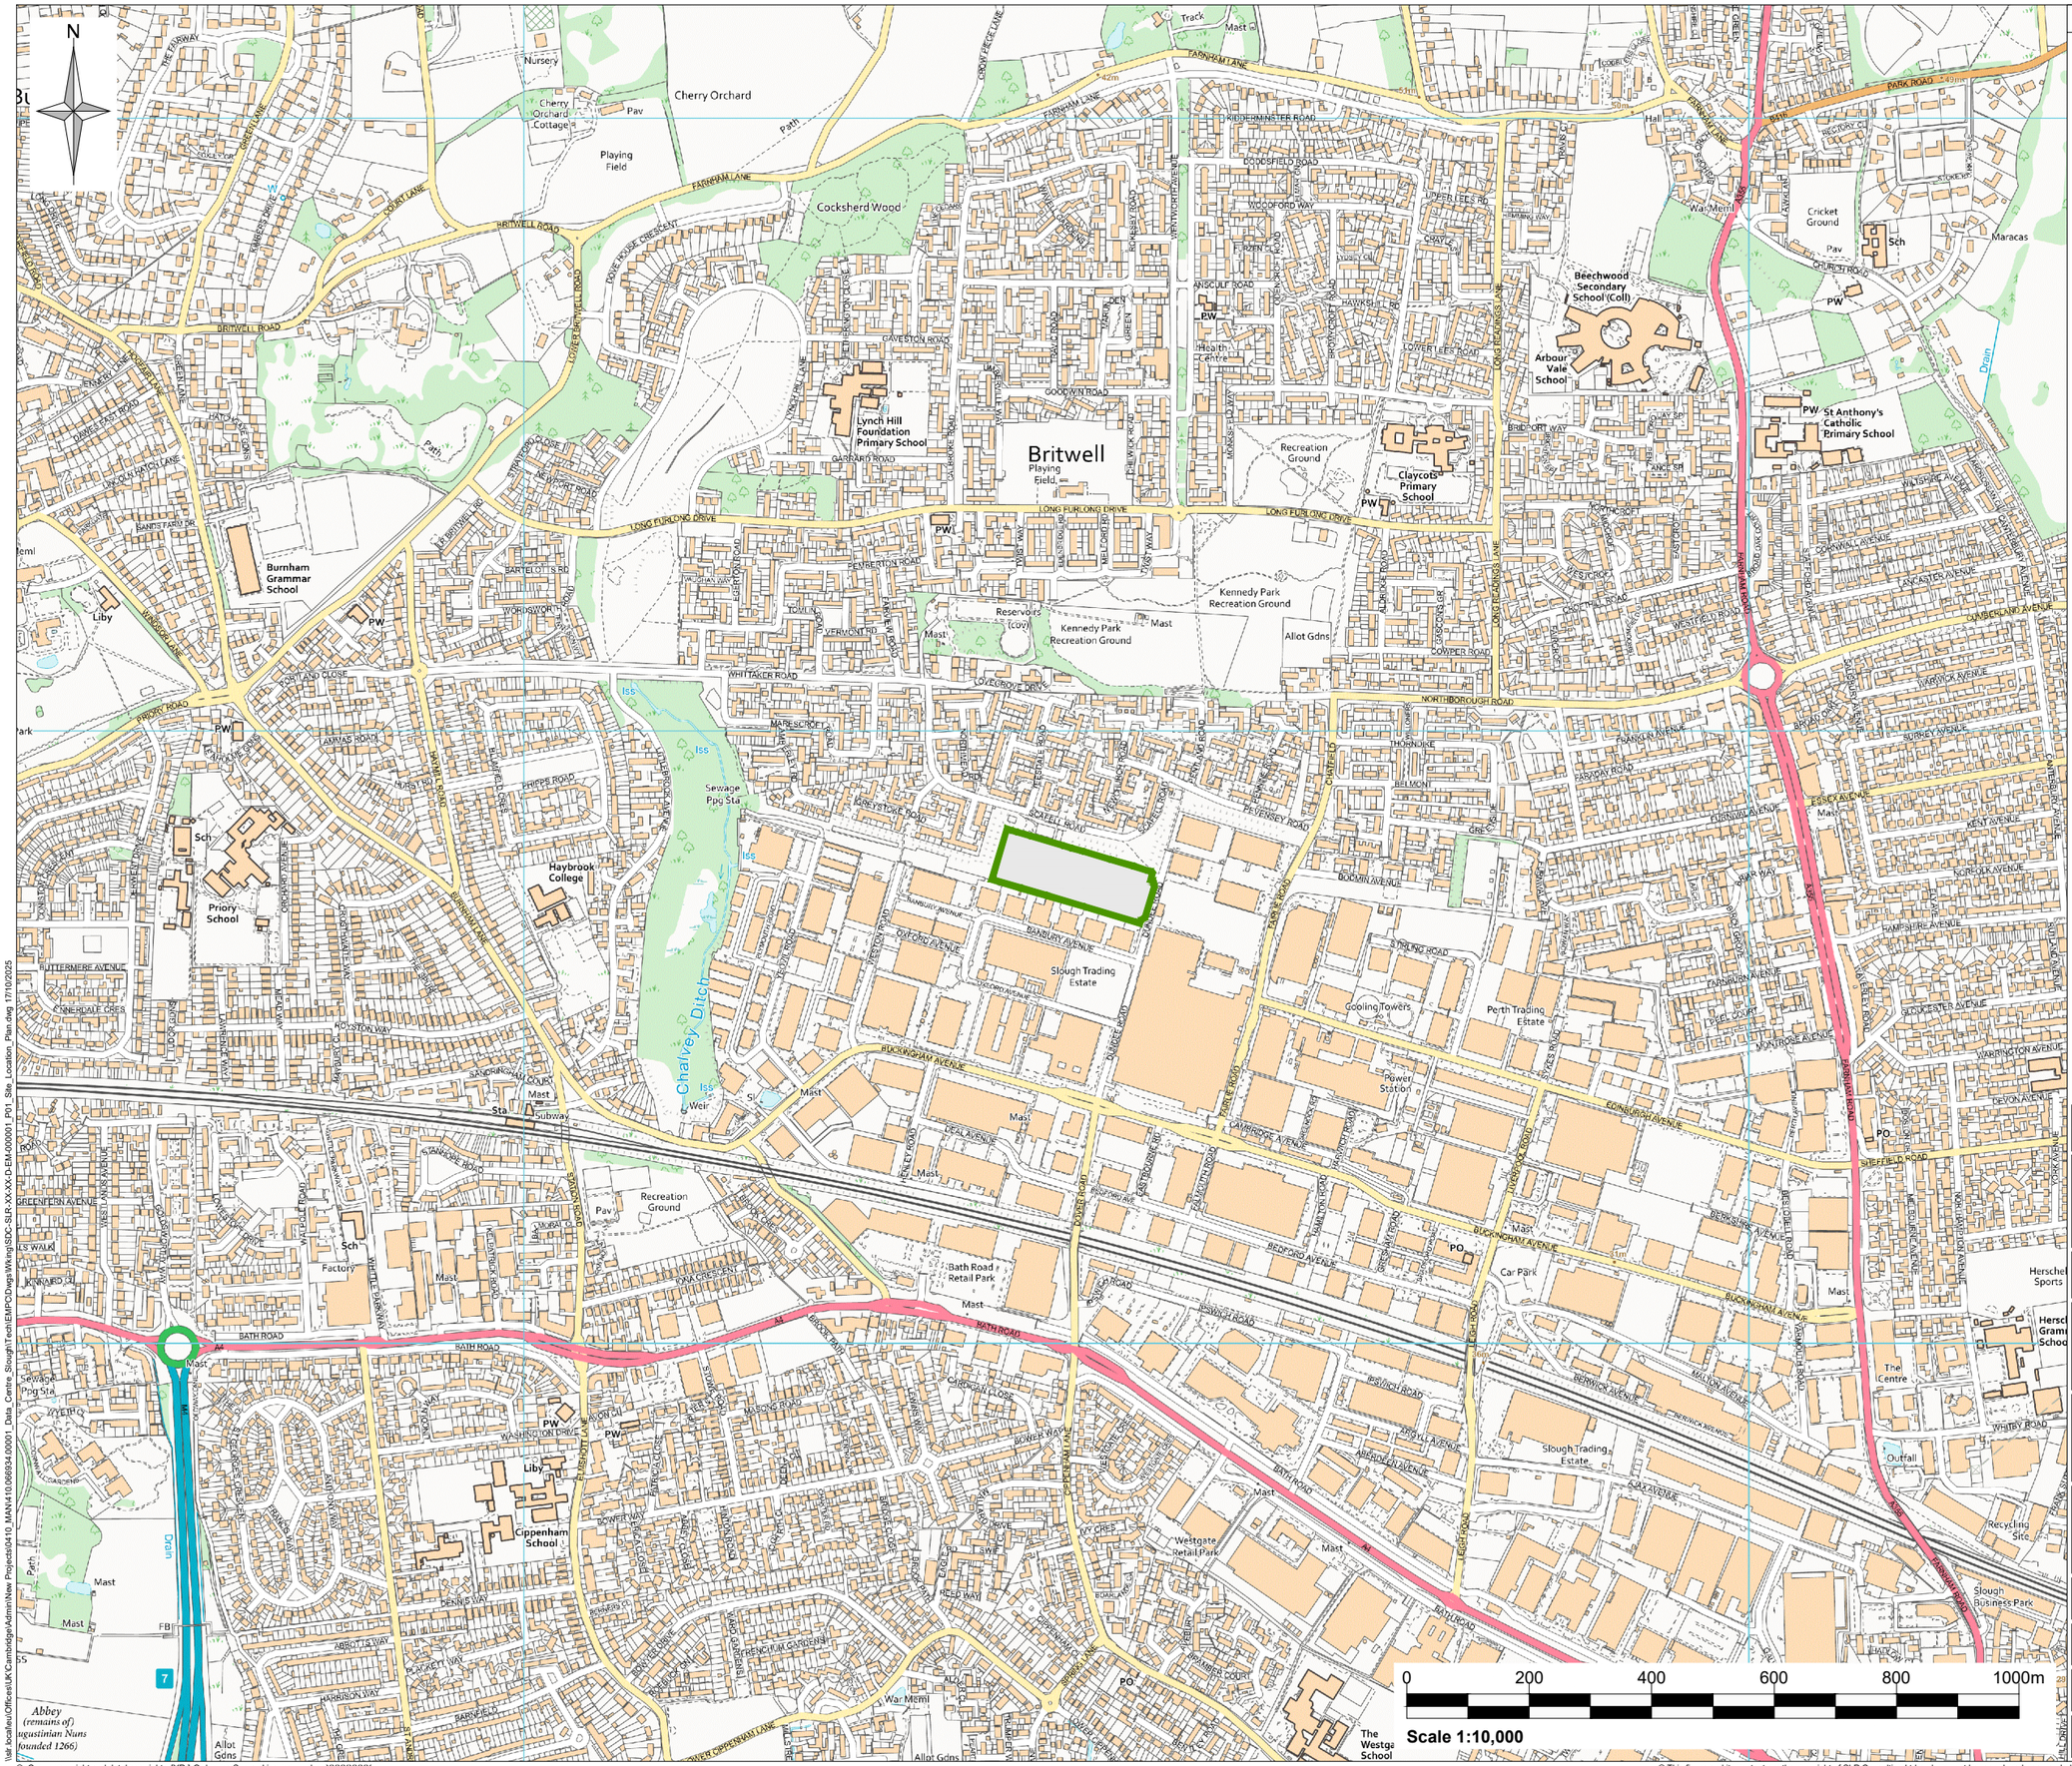

The relevant hazardous substances assessment for the site is presented in Table C-1 below. Where hazardous substances are stored internally on hard standing at the site and the risk of pollution of soil and groundwater as a result of accidental release is considered to be negligible, these substances are not considered further in this assessment.

Table C 1 Relevant Hazardous Substances Assessment

Chemical	CAS No	Container Type	Volume of Container (litre)	Amount Stored on Site (litre)	Internal or External Storage	Primary Containment	Secondary Containment	Tertiary Containment	Offloading Area Location & Offloading Procedure	Environmental Risk Phrases	Relevant Hazardous Substance	Carried forward to Stage 3 Assessment	Credible Risk of Pollution?
Diesel	68334-30-5	Metal tank	Up to 80,000l	410,633l	External	Double skinned tanks or some single skinned tanks	Bunding within plant room. Steel bunding around tank or lined concrete bund for larger bulk tanks	Concrete surfacing and cut off valve for surface water drainage.	Offloading procedure in place for oils.	H351category 2 carcinogen	Yes	Yes	Potential risk of pollution in event of major spillage
Oil and Grease for maintenance		Metal or plastic container	<200l	Maximum 200l	Internal	drums	Bunding	Concrete surfacing of site	Offloading procedure in place for drums.		No	No	No – secondary containment and small quantities used mean pollution is unlikely
