1.0 Introduction

GGP Consult has been instructed by Acorn Bioenergy Ltd to prepare a drainage impact assessment to establish the storage requirements associated with the operation function of the proposed anaerobic digestion plant.

The calculations will detail how surface water from the site will be managed, in compliance with local policy and an environmental permit.

2.0 Description of Existing and Proposed Site

The site has an area of 4.52ha and is entirely greenfield.

A topographical survey has been undertaken within the site and shown the site falling from 100mAOD at the north west to 88mAOD to the south east.

Refer to Appendix I for the existing topographical survey.

It is proposed to develop an anaerobic digestion plant, consisting of 5nr digestate tank, silage clamps, a digestate lagoon, gas equipment, material storage buildings, cellular storage crates and infiltration system, offices, substrate tanks, parking and additional miscellaneous equipment.

Site access is to be achieved from the A272 to the north west of the development.

Refer to Appendix II for the general layout.

3.0 Catchment Areas

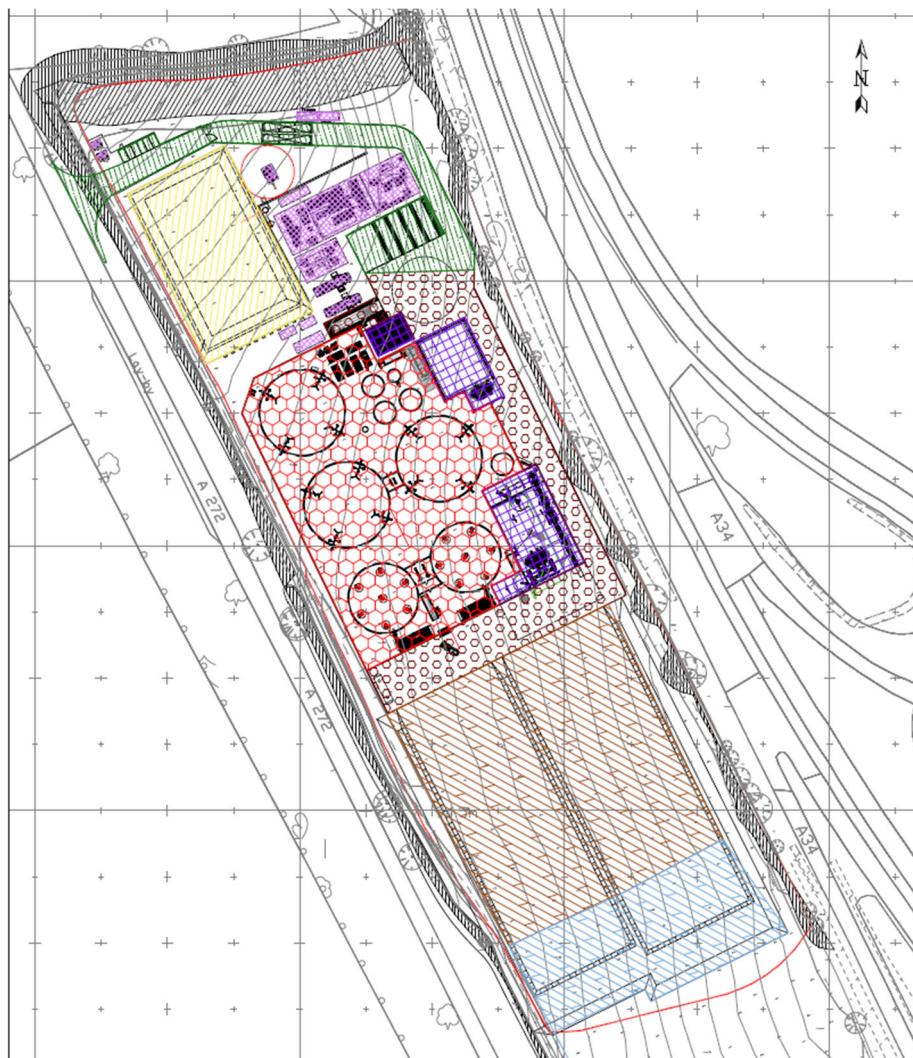

Various areas within the site will be subject to different operation functions, causing some areas being dirty and some clean, such that they require sealed drainage. Therefore, to improve water quality and optimise site efficiency, the site is split into catchments and subject to different drainage philosophies.

These catchments are classified in accordance with the environmental permit.

The site has been split into the following catchments in accordance with the best practice for environmental protection of land and water:

Catchment Area	Area
1 - Digestate Lagoon	3,042m ²
2 - Clean Roof Runoff	1,437m ²
3 - Clean Hardstanding with potential for petrochemical run-off	2,461m ²
4 - Clean Equipment Runoff	1,457m ²
5 - Clean/Contaminated Bund Runoff	8,323m ²
6 - Dirty Silage Clamp Runoff	9,118m ²
7 - Clean Silage Clamp Cover Runoff	3,696m ²
8 - Dirty water Hardstanding Runoff	3,745m ²
Total Catchment	33,279.0m²

Refer to Appendix III for the proposed catchment plan.

4.0 Design Philosophy

As stated within section 3.0, the site has been split into different catchments based on level of potential contamination. These catchments will be split into different drainage systems.

Two primary drainage systems will be adopted; clean and dirty.

In accordance with the approved SLR surface water drainage strategy, the site will be designed to contain all flows up to and including the 1:100 year event plus 40% climate change below ground.

Dirty Water runoff, caused by silage residue, from the silage clamps and sections of hardstanding area will be collected through a series of drainage channels, pipes, and chambers and be brought into a below ground holding pumping chamber. From this pumping chamber, runoff will be pumped to 3nr 400m³ holding chambers within the bund where it will be reused within the process.

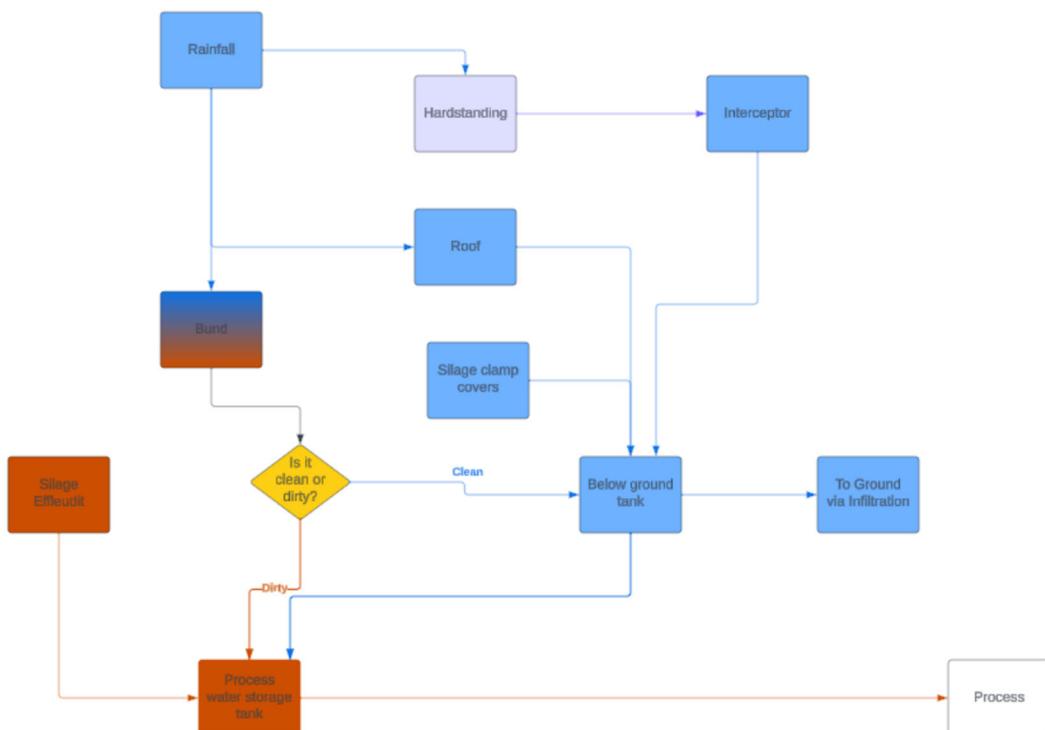

The process has a yearly demand of 42,000m³, equating to 1l/s continuous flow. This offers a sustainable drainage system, compliant with the hierarchy.

Clean runoff will be collected from buildings and sections of hardstanding and discharged into a cellular storage crates which will discharge surface water via infiltration. Petrochemicals may be present within the clean hardstanding runoff, which will be mitigated through a full retention petrol interceptor.

Runoff from the straw building will be captured and directed into a water storage tank for re-use in the straw processing.

Bund runoff has the potential to become contaminated through process residue. This will be collected through a channel drain and discharged into a pump chamber where it will be reused in the process. It may be tested and if clean released to the cellular storage crates as an emergency discharge during a heavy rainwater event.

To illustrate the principals adopted, the below rainfall / process flow diagram has been provided.

Rainfall / Process Water flow diagram – See Appendix IX

4.1 Water Quality

Due to the likelihood of contamination from the hardstanding and other open areas of the Site, it is recommended that SuDS source control and conveyance features are not adopted on the Site. Consequently, a full retention interceptor & catchpit will be adopted to mitigate runoff contaminants. Additionally, the proposed AD plant will operate under an Environmental Permit, with a strict operational & maintenance procedure in place. These procedures are developed to ensure compliance and protection of the local receptors.

As part of the environmental permit a detailed maintenance schedule will be regulated against. This shall cover the drainage, external surfacing, buildings & concrete containment bund as a minimum.

The drainage maintenance document typically outlines daily, weekly, biweekly, monthly, quarterly & year inspection work to be carried out, along with the necessary actions required.

Therefore, the proposed surface water drainage system shall conform and be regulated to a robust, audited & recorded operational & maintenance plan. This will ensure the performance of the drainage system is maintained throughout the life of the plant.

5.0 Proposed Discharge Rates

As mentioned within section 4.0, it is proposed to discharge clean surface water through infiltration.

Infiltration tests have been carried out within the site. An infiltration rate of 0.07308m/hr to the north and 1.3212m/hr to the south.

The northern part of the site is deemed to be clean and shall drain into a below ground cellular storage tank with infiltration.

The southern part of the site is deemed to be contaminated and shall be collected and pumped into above ground process storage tanks for re-use within the process.

Refer to Appendix IV for the proposed drainage layout.

6.0 Clean/Contaminated Bund Runoff

Rainfall collected within the bund has the potential to be contaminated through process residue. Therefore, runoff is collected and contained within the bund until it is sampled to determine if contamination is present.

If clean during extreme / heavy rainfall, runoff will be pumped to the cellular storage tanks. The preference will always to re-use the water within the process clean or dirty. If dirty, runoff will be pumped into the AD process for reuse.

Runoff must be sampled prior to discharge, therefore, when the site is unmanned, the bund will store runoff until sampling can be undertaken. The longest period the site will be unmanned is over a 12hr night period.

Therefore, the bund will be modelled within no outfall with the 12hr storm events will be taken as the critical event.

The bund has a slab level of between 92.200m – 91.650m AOD with a lowest top wall level of 93.300mAOD.

The bund has an area of 8,323m², 4,164m² of which is taken by the tanks, resulting in an available bund area of 4,159m².

These parameters have been used to model the bund within MicroDrainage ‘Source Control’. An extract of the structure can be seen below.

MicroDrainage ‘Source Control’ Tank/Pond Structure

The model has been run over a variety of storm events with the resultant volumes and depths detailed below.

Storm Event	Volume	Depth
1:1 Yr 12hr + 40%CC	279.4m ³	394mm
1:2 Yr 12hr + 40%CC	334.9m ³	418mm
1:10 Yr 12hr + 40%CC	469.1m ³	468mm
1:30 Yr 12hr + 40%CC	586.7m ³	504mm
1:100 Yr 12hr + 40%CC	749.8m ³	547mm

Refer to Appendix V for the full bond calculations.

7.0 Clean Northern Surface Water Runoff - Option 1

Surface water runoff from the buildings and clean hardstanding areas to the north of the site will be collected through a series of rainwater pipes, pipes, chambers and gullies and be brought to the hardstanding turning area to the north of the site pass through the full retention separator and be discharged into a below ground cellular storage crate.

Hardstanding areas will be discharged into a Klärgester NSFA030 Full Retention Separator to mitigate any collected petrochemicals.

The cellular storage has been designed to contain 342.1m³ of runoff which will infiltrate runoff in the ground.

An extract of the MicroDrainage 'Source Control' cellular storage structure can be seen below.

Cover Level (m)	<input type="text" value="93.192"/>	Storage is	<input type="text" value="Online"/>
		Dividing Weir Level (m) <input type="text" value="0.000"/>	
Infiltration Coefficient Base (m/hr)	<input type="text" value="0.07308"/>		
Infiltration Coefficient Side (m/hr)	<input type="text" value="0.07308"/>		
Safety Factor	<input type="text" value="2.0"/>		
Porosity	<input type="text" value="0.95"/>		
Invert Level (m)	<input type="text" value="91.000"/>		
Depth (m)	Area (m ²)	Inf. Area (m ²)	
0.000	<input type="text" value="300.0"/>	<input type="text" value="300.0"/>	
1.200	<input type="text" value="300.0"/>	<input type="text" value="383.0"/>	
1.201	<input type="text" value="0.0"/>	<input type="text" value="383.0"/>	
			Scale Factor (%)
			<input type="text" value="0"/>

The model has been run over a variety of storm events with the resultant volumes and depths detailed below.

Storm Event	Volume	Depth	Infiltration Rate
1:1 Yr 240hr + 40%CC	74.5m ³	261mm	3.2l/s
1:2 Yr 240hr + 40%CC	96.7m ³	339mm	3.3l/s
1:10 Yr 360hr + 40%CC	154.6m ³	543mm	3.4l/s
1:30 Yr 480hr + 40%CC	208.1m ³	730mm	3.6l/s
1:100 Yr 480hr + 40%CC	286.8m ³	1,006mm	3.8l/s

As shown above, all storm events are contained within the below ground cellular storage up to the 1:100 year event +40% CC.

Refer to Appendix VI for the full northern cellular storage calculations.

8.0 Clean Northern Surface Water Runoff - Option 2

If the collected bund runoff is clean, it is proposed to pump the collected runoff at a rate of 1.5l/s into the northern cellular storage crates. The 'cascade' function within Source Control has been used to model the flow from the bund into the cellular storage crates.

An extract of the cascade is shown below.

MicroDrainage 'Source Control' Cascade

The 1:100 Yr +20%CC has been used to calculate the highest occurring volumes and discharge rates within the cellular storage crates.

Storm Event	Volume	Depth	Infiltration Rate
1:100 Yr 16hr + 40%CC	338.9 ³	1189m	3.9l/s

As shown above, the swale contains all flows from the bund below ground when pumped at a rate of 1.5l/s.

Refer to Appendix VII for full northern cellular storage/bund cascade calculations.

9.0 Contaminated Silage Clamp/Hardstanding Runoff

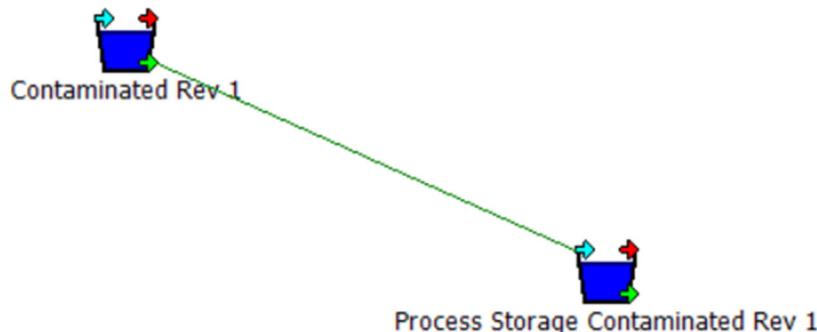

The runoff from the silage clamps and the surrounding hardstanding will be contaminated with leachate from the crop. As the contaminated runoff contains leachate, it has value to be reused within the process. Therefore, the site will use contaminated runoff as a main source of water.

Runoff will be collected through channel drains running along the front of the clamps where it will be discharged into an underground holding tank of 50m³. The area in front of the clamp may flood during storm event and been contained within the impermeable surface and kerbs / wall to the perimeter.

This will then be pumped into 3nr 400m³ holding tanks within the bund where it will be used within the process at an increase rate of 2.0l/s. This provides a total storage capacity of 1250m³.

The 'cascade' function within Source Control has been used to model the flow from the Yard into the Process Water Tanks.

An extract of the cascade is shown below.

MicroDrainage 'Source Control' Cascade

The model has been run over a variety of storm events with the resultant volumes and depths detailed overleaf.

As the site for a maximum unsupervised period of 12hrs, the peak and 12hr event will be analysed.

Storm Event	Volume (Yard)	Volume (Process Tanks)
1:2 Yr 12hr + 40%CC	51.9m ³	393.5m ³
1:10 Yr 12hr + 40%CC	52.0m ³	585.5m ³
1:30 Yr 12hr + 40%CC	52.0m ³	754.3m ³
1:100 Yr 12hr + 40%CC	52.0m ³	988.5m ³

The below also shows the peak storm for the yard with the volume in the process tank. Which would allow additional water to be pumped into the process tanks if required.

Storm Event	Volume (Yard-Peak)	Volume (Process Tanks)
1:2 Yr 30min + 40%CC	95.4m ³	159.2m ³
1:10 Yr 30min + 40%CC	165.5m ³	243.8m ³
1:30 Yr 60min + 40%CC	239.8m ³	404.5m ³
1:100 Yr 60min + 40%CC	349.5m ³	535.7m ³

Refer to Appendix VIII for silage clamp 2.0l/s calculations.

As shown within the above calculations, the contaminated drainage system will flood within the designed area and contained the full liquid volume up to and including the 1:100 year event +40CC.

10.0 Silage Clamp Clean Cover Runoff

The rainwater falling on the silage clamp will be directed onto a cover which will fall shed to the filter trenches on top of the clamp embankments.

These filter trenches will be directed to the rear of the clamp only collecting approximately ¼ of the full clamp. This has been determined based on the volume of material used on a daily basic and the percentage the clamps will be full throughout the year.

The filter trenches shall be collected to a trench soakaway located at the lower embankment level allowing runoff from the cover to infiltrate into the permeable strata.

The trench soakaway shall be constructed using the following parameters,

Infiltration Rate:	1.322m/hr
Safety Factor:	2.0
Fill Porosity:	30% (4/20mm or Type 3 Stone)
Invert Level:	92.000m AOD
Trench Width:	0.6m
Length:	96.0m

The 1:100 Yr +20%CC has been used to calculate the highest occurring volumes and discharge rates within the cellular storage crates.

Storm Event	Volume	Depth
1:100 Yr 30min + 40%CC	39.6m ³	94.292m AOD

Refer to Appendix VII for full northern cellular storage/bund cascade calculations.

11.0 Plant Water Demand Against Average Annual Rainfall

The site has been designed to contain all flows up to and including the 1:100 year +40% CC below ground.

An assessment has been undertaken to compare the average annual rainfall (AAR) against the process' water demand to determine if the process demand is greater than the harvested water.

From reviewing the process, it is expected the process has a yearly operation demand of 42,000m³, equating to a continuous flow of 1l/s.

Dirty water runoff will be isolated, retained and reused within the process. The northern area will not encounter any potential contamination, this catchment will be deducted through the analysis.

$$\text{AAR} = 0.787$$

$$\text{Area (Potential Contamination)} = 23,795^2$$

$$\text{CC} = 40\%$$

$$\text{Total annual rainfall (including climate change)} = 26,217\text{m}^3$$

As shown above, the plant has a greater demand than the yearly rainfall within the potential dirty water system with the addition of climate change.

Therefore, the collected runoff is recycled within the process, satisfying sustainability and drainage hierarchy requirements. Where possible the shortfall in water demand based on the average annual rainfall shall be collected from any clean water system and used within the AD process.

12.0 Summary

Following a site wide attenuation assessment, it has been demonstrated that the site provides various drainage systems with sufficient attenuation capacity while not exceeding permitted discharge rates.

The proposed clean runoff will be collected and attenuated within a below ground cellular storage crates. This will contain the 1:100 year +40%CC below ground.

The plant will harvest dirty and clean water runoff to be reused within the process at a constant rate of 1l/s. This will be contained in an underground 50m³ holding tank and 3nr 400m³ holding tanks within the bund.

The process water rate shall be temporary increased to 2.0l/s during period of extreme rainfall events, i.e. 1:100year event plus 40% climate change.

All runoff within the bund will be collected and sampled prior to discharge. In a heavy rainfall event, if clean water may be discharged as an emergency into the clean cellular infiltration crates.

Systems and pumps will be monitored, and data logged via a computer system with alarms to alert operators on or off site.

The site will operate under an environment permit with strict recording, sampling, and maintenance under full review.

The drainage system within the site will be under full ownership of the plant owners/operators operating under an Environmental Permit, with a robust, audited and recorded operation and maintenance plan. This will ensure the performance of the drainage system is maintained throughout the life of the plant.

APPENDIX I

Existing Topographical Survey

SURVEY NOTES

This survey has been carried out using a Trimble S9 Total Station and fixed to OSTN15 / OSGM15 using Trimble R12 GPS.

All Dimensions are In millimeters.

Parts of the Surveyed Area are labeled as Overgrown. These areas have been surveyed as best possible. Some features may not be surveyed in these areas.

Trees are not drawn to scale. Trunk size diameter and spread are estimated and should be used as a guide only.

All building descriptions and construction type are indicative only and taken externally from ground level.

Drainage runs between inspection covers have not been investigated. Any shown are estimated and not confirmed. All pipe sizes and connections should also be confirmed with your local drainage authority before commencing any design work.

There may be inspection covers on site which were not visible at the time of survey. It is possible that they are buried or covered by dense vegetation. Please consult your local drainage authority if you have any doubts.

All below ground details have been identified from above ground and therefore all details relating to these features including; sizes, depth, description etc will be approximate only. All critical dimensions and connections should be checked and verified prior to starting work.

Features may not have been surveyed if obstructed or not reasonably visible at the time of the survey.

General Notes

Please check and verify all site and building dimensions, levels, utilities and drainage details and connections prior to commencing work. Any errors or discrepancies must be notified to Parish Land Surveys.

The accuracy of the digital data is the same as the plotting scale implies.

Parish Land Surveys holds the copyright to all the information contained within this document and their written consent must be obtained before copying or using the data other than for the purpose it was originally supplied.

All Survey Data to Ordnance Survey National Grid (OSTN15) (OSGM15).

- NOTES:-**
1. All dimensions must be checked on site and not scaled from this drawing.
 2. The Contractor shall make a survey of the site and shall be responsible for obtaining all dimensions and levels necessary for the proper fabrication of the structure as indicated.
