Executive summary

The EA has requested Hydrographs to demonstrate relative impacts of the proposed flow regime, for example years in the dataset. This document uses only the EA's naturalised flow dataset 1990-2016 rather than actual gauged data, as requested by the EA. This document therefore presents Hydrographs for the driest year 2003, an average year 1997, and the wettest year 2012. This document is to be read in conjunction with the Hydrology Assessment which characterises the project and the proposed regime.
