

JATEL_ Proposed Improvements

Johnsons Aggregates and Recycling have been successfully running IBA processing plants for a number of years and have gained vast experience.

Once the Permit is issued and the site is workable the organisation will identify the best practises required to control the process run off and site drainage. The proposed site as a natural incline which will aid the channelling of waters in the required direction.

Once the site is in the pre-operational stage the organisation will assess the condition of the ground and from the experienced gained design and implement an effective drainage system.

As required the designated areas will be covered with an impermeable surface with integrated drainage channels directing the run-off water into a collection point, wedge pit.

This may be one or two strategically place collection points as deemed necessary once a survey has been completed.
