Revision Schedule

Revision	Author	Description	Date
1	Alex Large	Minor edits following Client review including Envirocheck report and Historical Maps included as appendices.	01-Nov-2024
2	Alex Large	Risk assessment updated to include additional details relating to soil washing.	11-June-2025
3	Alex Large	Risk assessment updated to take into account mapping provided by the Environment Agency showing the Carn Brae local wildlife site, located 170 m to the south of the Site at its nearest point.	27-Feb-2026

1. Introduction

1.1 Commission

- 1.1.1 Horizon Consulting Engineers Limited (Horizon) was commissioned by Harts Haulage Ltd to prepare an environmental risk assessment in support of an application to the Environment Agency to vary the Ladds Recycling Yard Environmental Permit (reference: EPR/GB3002HA). Ladds Recycling Yard (the Site) is located at Wilson Way, Redruth, Cornwall, TR15 3RT.
- 1.1.2 The Site currently produces soil, soil substitutes and aggregate under a standard rules SR2010 No.12 Environmental Permit. In December 2024, the Environment Agency withdrew the Standard Rules SR2010 No.12 permit, and replaced it with the SR2022 No.1 Permit. On the basis that the activities at the Site no longer comply with the new standard rules permit, Harts Haulage is applying to vary their permit to a bespoke permit.
- 1.1.3 Revision 2 and subsequent revisions of this report have been updated to include additional details relating to soil washing.

1.2 Background

- 1.2.1 Following the withdrawal of the Standard Rules SR2010 No.12 Environmental Permit in late December 2024, the risk assessment for Ladd's Recycling Yard has been updated. The updated risk assessment takes into account (1) Environment Agency guidance on non-hazardous and inert waste: appropriate measures for permitted facilities¹; (2) the risk assessment prepared for the new Standard Rules permit SR2022 No.1; and (3) allows for soil and aggregate washing (a physico-chemical treatment activity as opposed to separation or sorting).
- 1.2.2 Moving forwards the Site will continue to operate as a waste recycling facility with similar non-hazardous waste types imported for separation and treatment. Hazardous waste will not be accepted at the Site, nor will any wastes in a liquid form.
- 1.2.3 The operations will continue to be conducted in accordance with an updated bespoke Environmental Permit. The principal changes compared with Harts Haulage's existing permit are set out in Section 2 and summarised below:
- Maximum throughput to be increased to 250,000 tonnes/year;
 - Maximum waste stored on-Site at any one time increased to 75,000 tonnes;
 - Amendments to waste codes and operating procedures; and
 - Addition of soil and aggregate washing (a physico-chemical treatment activity)
- 1.2.4 This risk assessment is to be submitted to the Environment Agency for approval.

1.3 Aims and Objectives

- 1.3.1 In view of the above, the purpose of this risk assessment is to:
- *Identify and assess potential risks to human health and the environment associated with the proposed permitted activities; and*
 - *Identify appropriate mitigation measures to manage potentially unacceptable risks.*

¹ <https://www.gov.uk/guidance/non-hazardous-and-inert-waste-appropriate-measures-for-permitted-facilities> [Accessed 27 February 2025]

1.4 Methodology

- 1.4.1 The approach, scope and methodology of this risk assessment have been developed and conducted in general accordance with Client requirements and Environment Agency guidance.
- 1.4.2 Descriptions of drainage are based on details provided by the Site Operator.

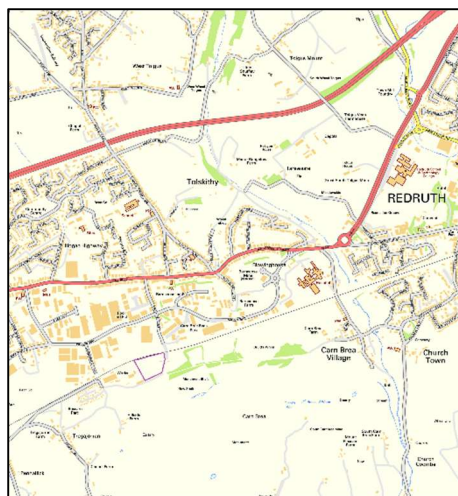

2. Site Setting

2.1.1 Data on the existing conditions at the Site has been collated based on a Site walkover survey (11 October 2024), photographs provided by the Client, an Envirocheck report (**Appendix A**) supported by publicly available information.

2.2 Location

2.2.1 The Site is to the west of the town of Redruth in Cornwall. The approximate Site centre is located at Ordnance Survey grid reference: SW6780441141.

2.2.2 A Site location map is provided as **Figure 3-1** with the approximate Site boundary shown in purple.

Contains Ordnance Survey data © Crown Copyright and database right 2026

Figure 2-1: Site Location Plan

2.3 Site Description

2.3.1 Photographs showing the Site are presented in **Appendix B**. The Site, occupying an area of circa 1.4 Ha, is located immediately south of the Great Western Railway line. The Site is located to the south of a large industrial area, with other industrial activities to the north (beyond the railway) and to the west.

2.3.2 The Cam Brae hill is located immediately south of the Site, rising to a level circa 100 m higher than the elevation of the Site. Immediately west of the permitted area (i.e., the Site) is additional yard owned and operated by Harts Haulage for their lorry business, with a transient caravan park beyond. To the east is open land with new residential properties to the north-east, beyond the railway line.

2.3.3 The Site is surfaced with concrete hardstanding.

2.4 Site History

2.4.1 Historical maps showing the Site are included in **Appendix C**. In summary, the Site is shown as being part of the wider Carnbrea Mine on the earliest available mapping (dated 1880). The mine is marked as extracting tin and copper, with shafts, chimneys, buildings and excavations variously marked across the Site. The Great Western Railway line is located directly north of the Site.

2.4.2 The Site is mapped as being a mine until the mid-1960s, following which the Site is described as being an old mine or disused. By 1989 the Site is marked as being part of a wider Pre-Cast Concrete Works. During this time the Site is shown as open space with no features mapped within the Site. In June 2018 the current Environmental Permit was issued enabling the use of the Site for soil and aggregate recycling purposes.

2.5 Geology & Hydrogeology

2.5.1 Interpretation of the regional and local geology has been developed with reference to the British Geological Survey mapping². In summary, the north of the Site is underlain by the Mylor Slate Formation, described as “*Dark grey, locally green-grey slates, interbedded with thin bands and laminae of sandstone, graded and locally cross-bedded siltstone, basic lavas and sedimentary breccias.*” The south of the Site is underlain by granite of the Carnmenellis Intrusion.

2.5.2 No superficial deposits are mapped beneath the Site however given the history of the Site for mining, it is identified as being underlain by potentially infilled ground.

2.5.3 The bedrock is classified as a Secondary A Aquifer defined as “*permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers.*”

2.5.4 The Site is not located in a Groundwater Source Protection Zone, as classified by the Environment Agency.

2.6 Local Water Features

2.6.1 No surface water features are present on-Site. The nearest surface water feature is an unnamed watercourse located circa 200 m south-east of the Site.

2.6.2 This is consistent with the requirements of the existing permit which requires that activities must be 10 m from any watercourse and be 50 m from any spring or well, or of any borehole not used to supply water for domestic or food production purposes or 50 m from any spring or well or any borehole used for the supply of water for human consumption. This must include private water supplies.

2.6.3 There is one active Discharge Consent within a 1 km radius of the Site, permitted to a domestic property for sewage discharge to land. The soakaway is approximately 816 m north of the Site.

² www.bgs.ac.uk [Accessed 01 October 2024]

3. Proposed Activities

3.1 Preamble

3.1.1 The activities at the Site are intended to meet the following codes:

- R3: Recycling and reclamation of organic substances which are not used as solvents;
- R5: Recycling and reclamation of other inorganic materials; and
- R13: Storage of wastes pending any of the operations numbered R1 to R12 (excluding temporary storage, pending collection, on the site where it is produced).

3.1.2 Further details in relation to the activities is set out in the remainder of this section of the report.

3.2 Waste Codes

3.2.1 The list of waste codes proposed for acceptance is set out in Appendix B of the Environmental Management System³ (EMS).

3.2.2 Wastes having any of the following characteristics shall not be accepted:

- Consisting solely or mainly of dusts, powders or loose fibres;
- Hazardous wastes; or
- Wastes in liquid form.

3.3 Storage

3.3.1 Waste is temporarily stored on-Site pending recycling. The following limits are to be applied to the storage of waste:

- No more than 75,000 tonnes in total of waste shall be stored at any one time.
- No waste shall be stored for longer than 12 months.
- No more than 250,000 tonnes of waste in total shall be accepted per year.

3.3.2 Waste storage takes place on concrete hardstanding. Waste storage does not take place within an enclosed building at Ladd's Recycling Yard; the risk assessments developed take this into account.

3.4 Recycling

3.4.1 Recycling of aggregates at Ladd's Recycling Yard includes sorting and separation followed by crushing of suitable imported waste soil and aggregates. This will continue with the following materials produced

- Aggregates are to be recovered according to Harts Haulage Quality Protocol and tested in accordance with end of waste criteria. The recycled aggregates are then sold or used on-Site where required; and
- Topsoil is tested and sold for use off-Site in accordance with the Environment Agency's Regulatory Position Statement RPS190⁴.

³ Horizon (March 2026) Ladds Recycling Yard. Environmental Management System. Ref: HCE1198.EMS

⁴ <https://www.gov.uk/government/publications/use-of-manufactured-topsoil-rps-190> [Accessed 06 January 2025]

3.5 Soil Washing

- 3.5.1 In addition to sorting and separation plus crushing, moving forwards Harts Haulage will undertake soil washing of waste soil and aggregates as part of this recycling operation. The waste types will continue to comprise brick, concrete, soil and stones from construction and demolition activities. The soil wash plant is a state of the art, closed-loop wash plant water treatment system designed to recycle and re-use water, thereby minimising water loss and reducing the need for fresh water intake. Such systems are commonly used in mining, sand and gravel processing, and other industries that rely heavily on water for washing and separating materials.
- 3.5.2 Washing of soil/stone mixtures will be carried out to produce a clean granular product. Waste will be loaded into a feeder scalper and then screened into different fractions (sized) through a series of barrels, cyclones and screens. Clarifiers and settling tanks are initially used to separate out heavier solids, with additional equipment such as hydrocyclones and centrifuges used to further dewater solids and recover water. The remaining water is treated to remove fine particles, organic matter, or chemicals. Treated water is pumped back into the wash plant for reuse, creating a "closed loop" that significantly reduces water wastage.
- 3.5.3 The collected solids are processed into a manageable form (e.g., dried cake) for disposal or reuse. A schematic showing the general process is included in **Appendix D**.
- 3.5.4 The soil wash plant at Ladds Recycling Yard is a closed-water circuit, such that all liberated clarified water is returned via the thickener / clarifier to the wash plant process. There is no routine discharge of wash water from the unit. The closed-water circuit minimises top-up water requirements (water is typically only lost as moisture in the filter cake) and this is minimised given a filter press is used to squeeze water out of the filter cake. Water recovered from the filter press is returned to the wash plant.
- 3.5.5 Given the aim of the wash plant is to screen and segregate different soil fractions, as opposed to cleaning chemical contaminants, routine monitoring of the wash plant is not required. In the event that unacceptable chemical contaminants are identified in the soil fractions (e.g., testing as part of compliance with the WRAP protocol⁵), testing of the wash water would take place with samples sent to a UKAS accredited laboratory. In the event dirty wash water is required to be drained from the wash plant, this is to be disposed off-Site as waste to a suitably licenced facility.

⁵ Environment Agency (October 2013) Quality Protocol. Aggregates From Inert Waste. End of Waste Criteria for the Production of Aggregates from Inert Waste.

4. Sensitive Land Uses

- 4.1.1 The Site currently has a Standard Rules SR2010 No. 12 permit, the requirements for which include that the activities shall not be carried out within:
- 500 m of a European Site (candidate or Special Area of Conservation, proposed or Special Protection Area or Ramsar site) or a Site of Special Scientific Interest (SSSI);
 - 250 m with the presence of great crested newts, where it is linked to the breeding ponds of the newts by good habitat;
 - 50 m of a site that has relevant species or habitats protected under the Biodiversity Action Plan that the Environment Agency considers at risk to this activity; or
 - 50 m of a National Nature Reserve (NNR), Local Nature Reserves(LNR), Local Wildlife Site (LWS), Ancient woodland or Scheduled Ancient Monument.
- 4.1.2 Statutory and non-statutory receptors in the wider vicinity of the Site are shown on the Envirocheck report in **Appendix A**. Outputs from Defra's Magic Maps website showing woodland in the vicinity of the Site are included in **Appendix E**. In addition, mapping provided by the Environment Agency showing the Carn Brae local wildlife site, located 170 m to the south of the Site at its nearest point, is included in **Appendix F**.
- 4.1.3 The main sensitive land uses / potential receptors identified within a 2 km radius of the Site that may be affected by the works at the Site are shown on the Sensitive Receptors Proximity Plan in **Appendix G**.
- 4.1.4 The Site is not located in a groundwater Source Protection Zone, as classified by the Environment Agency.

5. Pollution Control Measures

5.1 Preamble

5.1.1 This section of the report summarises measures to be used to control pollution from import, storage, treatment of waste materials at the Ladds Recycling Yard site. These measures have been developed with reference to Environment Agency guidance on non-hazardous and inert waste: appropriate measures for permitted facilities¹.

5.1.2 The magnitude of potentially unacceptable emissions will be determined by factors including:

- The quantity of waste stored at any location;
- Wind direction and speed;
- Weather conditions; and
- Potential for a receptor to be exposed.

5.1.3 Section 6 sets out the risk assessments prepared, taking into account the pollution control measures set out in Section 5.

5.2 Management System

5.2.1 An EMS³, prepared with reference to Environment Agency guidance⁶, is in place at Ladds Recycling Yard.

5.3 Waste Acceptance

5.3.1 Only material meeting the waste codes (see Appendix B of the EMS³) is to be imported to Site. Material classification and acceptance at the Site is the responsibility of the Operator, Harts Haulage.

5.3.2 The wastes accepted onto the Site specifically exclude liquid wastes and waste-types that could potentially have a 'wet' component.

5.4 Security

5.4.1 The Site is secured with gated access. Gates are securely locked shut at all times outside the hours of operation. The Site perimeter is bound by fences. The boundary fence is inspected at least once per week to check it is intact. CCTV security cameras are installed at the Site. There is a Site presence nearly 24 hours per day.

5.5 Flooding

5.5.1 The Site is identified as being in Flood Zone 1⁷, defined as "*land having a less than 1 in 1,000 annual probability of river or sea flooding.*" Flood mapping is included in **Appendix A**. Review of Environment Agency mapping does not identify the Site as having the potential to form a pathway for overland flow. Given the Site is not considered to be at risk from flooding from surface water features a flood related response plan has not been developed.

⁶ <https://www.gov.uk/guidance/develop-a-management-system-environmental-permits> [Accessed 27 February 2026]

⁷ <https://flood-map-for-planning.service.gov.uk/> [Accessed 12 June 2017]

5.6 Stockpile Management Plan

5.6.1 On-Site handling of imported waste is kept to a minimum:

- Soil will be placed in the driest condition possible. Operations will take place year-round, however constraint should be adopted during periods of particularly inclement weather;
- Movement of dumpers and lorries is confined to designated haul routes. All vehicle movements take place on concrete hardstanding;
- A maximum side slope of 1 in 2 (25°) is to be adopted for temporary stockpiles;
- In the event weeds appear on the stockpiled soils, active weed management will be undertaken;
- Clear signs are in place to direct lorries to the correct location; and
- If waste is not to be processed directly, the surface of stockpiles will be sealed (i.e., lightly compacted and shaped to prevent ingress of rainwater and stockpile erosion).
- Incoming wastes are stockpiled in the centre of the Site with products typically stored in bays around the edge of the Site. The location of waste and product storage areas may evolve however clear separation is to be maintained between waste and product stockpiles at all times.
- The Technically Competent Person is responsible for the waste management plan (requirements set out in EMS) including managing the size and shape of each stockpile will be recorded, along with details of the waste type stored.

5.6.2 All waste stockpiles are placed on concrete hardstanding. Hardstanding⁸ is defined as “ground surfaced with a durable permeable material. It must be capable of remaining level and rut free and being kept clear of debris. It must be maintained so that it does not cause surface water ponding.”

5.6.3 Historically the Site has predominantly accepted hardcore and soil for recycling and this is planned to continue as part of the permit variation. The rationalising of the waste codes as part of the bespoke permit variation will reduce the odour potential further (e.g. waste code 02 02 02 *shellfish shells from which the soft tissue or flesh* has been removed).

5.6.4 On the basis of the above, the risk from odour is considered to be very low and a site specific odour management plan has not been prepared.

5.7 Fugitive Emissions (Waste Storage)

5.7.1 Environment Agency guidance on non-hazardous and inert waste: appropriate measures for permitted facilities¹ requires that “*you must store and treat all waste on an impermeable surface with contained drainage that meets CIRIA C736 or an equivalent approved standard. The impermeable surfaces must have sealed construction joints. These requirements do not apply in designated areas where the waste being stored or handled does not pose any significant risk of contaminating surface water or groundwater.*”

⁸ <https://www.gov.uk/government/publications/sr2022-no-1-treatment-of-waste-to-produce-soil-soil-substitutes-and-aggregate> [Accessed 05 March 2025]

- 5.7.2 It is noted that the Environment Agency's risk assessment for a Standard Rules SR2022 No.1 permit has evaluated the risk associated with the waste types and quantities permitted and location restrictions associated with this Standard Rules permit (i.e., as per the last sentence in the paragraph above). Taking into account the waste codes permitted at Ladds Recycling Yard (set out in Section 3.2) the following restrictions are in place:
- up to 250,000 tonnes of waste per year to be accepted at the Site; and
 - up to 75,000 tonnes of waste to be stored on Site at any time.
- 5.7.3 At Ladds Recycling Yard, all waste storage and treatment takes place on concrete hardstanding.
- 5.7.4 There are no known below ground features (e.g. services, ducts, old mine workings, storm drains) present in this area other than shallow electrical ducting directly below the concrete surfacing connecting various elements of the wash plant.
- 5.7.5 The Environment Agency concluded that wastes of the nature and quantity allowed under a SR2022 No.1 permit could be stored and treated on hardstanding subject to meeting certain location restrictions, and the minimum off set distances for a Standard Rules SR2022 No.1 permit are met. At Ladd's Recycling Yard the waste codes are more restrictive and all waste storage and treatment takes place on concrete hardstanding.

5.8 Fugitive Emissions (Soil Wash Plant)

- 5.8.1 Environment Agency guidance on non-hazardous and inert waste: appropriate measures for permitted facilities¹ requires that *"all above-ground tanks containing liquids (whether waste or otherwise) that could be harmful to the environment if spilled must be kept on an impermeable surface with contained drainage that meets CIRIA C736 or an equivalent approved standard."* Furthermore, the guidance states that *"you must provide bunds for all tanks containing liquids (whether waste or otherwise) that could be harmful to the environment if spilled."*
- 5.8.2 CIRIA C736⁹ sets out a risk-based approach to the design of containment systems for the prevention of pollution with the risk assessment used to inform the design, inspection and maintenance regime and risk reduction measures. The principal role of the containment system is to break the pathway between the source (i.e., the inventory in the primary container) and any potential receptors (e.g. watercourses, groundwater, habitats).
- 5.8.3 In the context of the soil wash plant at Ladds Recycling Yard, the source comprises wash plant liquids. The Aquacycle has a capacity of 120 m³; this is considered to be consistent with the capacity of the hydraulically-linked tanks. The nature of the liquid is assumed to comprise silt-laden water, with low concentrations of chemical contaminants.
- 5.8.4 The soil washing plant is located towards the south-east of the Site, within the existing permit boundary, underlain by concrete hardstanding. The soil washing plant is not located within a building, however is underlain by a sealed drainage system.
- 5.8.5 On the basis that the liquid in the treatment plant is of relatively low environmental sensitivity plus the absence of flammable substances (thereby negating the need for containment of firefighting water), the containment must be capable of retaining:

⁹ CIRIA (2014) Containment Systems for the Prevention of Pollution. Secondary, Tertiary and Other Measures for Industrial and Commercial Premises. C736

- The total volume of inventory that could be released during a credible incident; and
 - The maximum rainfall that would be likely to accumulate within the containment before, during and/or after an incident.
- 5.8.6 CIRIA C736⁹ recommends that the capacity of the containment system be “*at least 100% of the primary capacity for single tank installations or based on risk assessment based on a credible scenario for multi-tank installation taking into account tertiary containment provision.*”
- 5.8.7 At Ladds Recycling Yard the wash plant area has been designed to incorporate a fully contained and sealed drainage system. The existing concrete hardstanding has been supplemented by raised concrete blocks on three sides of the wash plant (north, east and south) with the northern side partially contained by concrete blocks. The fall of the concrete means any water falling in the wash plant area will initially drain back towards the plant and be contained by the concrete blocks.
- 5.8.8 Outwith the wash plant area, the Operator has advised surface-water generated from rainfall that falls on the concrete slab within the vicinity of the wash plant is directed towards a below-ground structure comprising three large chambers is located to the west of the permitted area, beyond the industrial unit located immediately to the south-west. This then discharges into a wedge-pit (capacity estimated at 200 m³). Harts Haulage recently installed an additional wedge-pit adjacent to the primary wedge-pit of similar capacity to provide redundancy to the system.
- 5.8.9 The wedge-pits are pumped out by the Operator for dust suppression water supply, plus the Operator intends to connect a pump from the primary wedge-pit to the soil wash plant to provide top up water on an as required basis.
- 5.8.10 It is envisaged fugitive emissions (i.e., silt laden water) would follow the existing overland flow routes and be collected within the below ground structure. Further improvements are currently in progress to the concrete surfacing, with areas to the west of the permitted area, currently surfaced with hardstanding as opposed to concrete, to be surfaced with concrete by end March 2026.

5.9 Emissions to Air / Dust

- 5.9.1 The standard rules risk assessment states that “*permitted waste types are inert and non-hazardous and do not include dusts, powders or loose fibres and have a low potential to produce bioaerosols.....*”. Notwithstanding this the treatment activities have the potential to produce particulate matter, particularly in periods of dry weather.
- 5.9.2 The prevailing wind direction is south-westerly. The Site is located to the south of a large industrial area, with industrial premises to the north beyond the railway cutting. The nearest residential properties are new developments located 80 m east-north-east of the Site, beyond the railway line. Other residential properties are located approximately 220 m to the south-west with a transient caravan site located circa 200 m west (i.e. upwind based on prevailing wind direction). No complaints have been received in relation to dust from activities on-Site nor was dust identified as an issue during Environment Agency compliance assessments.
- 5.9.3 The Site benefits from concrete hardstanding with other measures used on site to control dust/particulates including:
- **Site / process layout in relation to receptors.** Stockpiles are generally located in the centre of the Site, away from off-site receptors within the constraints of the Site.

- **Site speed limit, no "idling" policy and minimisation of vehicle movements on-Site.** A no idling policy is adopted, with designated traffic routes for lorries to minimise potential for tracking material from waste storage areas.
- **Minimising drop heights for waste.** All waste deposition is undertaken in a manner to minimise the drop height.
- **Good housekeeping.** The Site was described as clean, tidy and well organised during the most recent Environment Agency inspection. Housekeeping has not been identified as an issue by the Environment Agency during compliance assessments.
- **Minimisation of waste storage heights and volumes on-Site.** The proposed changes will increase the size of stockpiles on-site with the potential to increase the surface area over which particulates can be mobilised. Stockpiles to be managed as part of daily visual inspections by the Operator, including covering as required.

5.9.4 Given the proposed increase in storage and throughput a Site-specific Dust & Emissions Management Plan¹⁰ (DEMP) has been prepared to ensure emissions are adequately controlled.

5.10 Emissions to Water

5.10.1 No other direct or indirect discharges are permitted from areas of the Site used for the storage, treatment or deposition of wastes. All waste treatment activities are to take place on a hardstanding surface.

5.10.2 Process water from the soil washing process is recirculated as the process is a net user of water.

5.11 Emissions to Sewer

5.11.1 There are no point source emissions to sewer. The offices are serviced by septic tanks.

5.12 Fire Prevention Plan

5.12.1 The standard rules risk assessment states "*permitted waste types do not include flammable materials so a low magnitude risk is estimated*". Furthermore, as part of the permit variation a number of waste codes have been removed including 03 01 01 *waste bark and cork* and 03 03 01 *waste bark and wood*.

5.12.2 Given the above, a standalone Fire Prevention Plan (FPP) is not considered warranted as part of the proposed permit which is primarily related to increased throughput and maximum waste storage capacities of inert materials.

5.13 Odour Management Plan

5.13.1 Consistent with the requirements of a Standard Rules Permit, an odour management plan is to be prepared if warranted based on emissions from the Site. The associated standard rules risk assessment states that "*permitted waste types have low odour potential*" and to date no complaints in relation to odour have been received.

5.14 Noise Management Plan

5.14.1 A noise and vibration management plan is typically required by the Environment Agency if:

¹⁰ Horizon (October 2024) Ladds Recycling Yard. Dust & Emissions Management Plan. Ref: HCE1198.DEMP

- *“we think there may be a risk of noise and vibration pollution beyond the site boundary; and*
- *you have done a noise impact assessment as part of your risk assessment.”*

5.14.2 Guidance states that the Environment Agency may ask you to submit a noise and vibration impact assessment and a noise management plan if:

- *your activity uses noisy plant or machinery, for example cooling equipment or fans*
- *you will be doing any noisy operations, such as loading or unloading, shredding, shearing, crushing, grinding, combustion, using trommels and conveyors or moving bulk materials*
- *your activities are not contained within buildings*
- *some of your activities take place at night*
- *the area where you are planning to carry out your activity is sensitive to noise, for example rural areas may have quieter background noise levels than urban areas*
- *there are sensitive receptors close to the site, for example houses or habitats*

5.14.3 The activities at Ladds Recycling Yard are being conducted in the centre of a large Site which is located in a relatively remote area. To the north of the Site is a railway and further industrial land uses, with the nearest noise sensitive receptors (residential properties) 80 m east-north-east (i.e., beyond the railway line) and more than 200 m to the west / south-west.

5.14.4 The operations on-Site, in particular processing and treatment of waste, occur sporadically during typical working hours, with no activities taking place at night.

5.14.5 Notwithstanding the above, a standalone noise management plan has been prepared based on a noise impact assessment to evaluate the risk of noise and vibration pollution affecting noise sensitive receptors beyond the Site boundary.

5.15 Pest Management Plan

5.15.1 Pests may be present when conditions on-Site are favourable for their existence. Furthermore the longer the period of time that waste remains untouched on-Site the potential for pests increases.

5.15.2 The standard rules risk assessment states that *“permitted waste types unlikely to attract pests”*. This has been further assessed as part of the site-specific risk assessment. The increased throughput on-Site will reduce the period of time that waste remains unprocessed and the waste types accepted do not include materials (e.g. putrescible household waste, plastic and paper) identified as being at the greatest risk of pest infestation. In addition, the rationalisation of permitted waste codes (e.g. removal of 02 02 02 *shellfish shells from which the soft tissue or flesh has been removed*) further reduces the potential for scavenging animals and birds.

5.15.3 As part of routine housekeeping the Site conducts litter collections after windy weather on an as required basis to ensure the Site, including its boundaries, is kept clear of litter and rubbish irrespective of its source.

5.15.4 It is noted that scavenging animals / birds have not been an issue thus far based on the nature of wastes accepted. In the event that this situation changes a pest management plan is to be prepared, consistent with the requirements of a Standard Rules risk assessment.

5.16 Incompatible Substances

- 5.16.1 All imported wastes are required to meet the waste codes set out in Section 3.2. The waste codes are all not hazardous and not considered to be incompatible.

6. Risk Assessment

6.1 Rationale

6.1.1 The risk assessment looks to identify possible relationships between contaminants, pathways and receptors and is used to identify relevant contaminant linkages that may warrant further assessment and/or remedial actions.

6.1.2 Consistent with Environment Agency guidance, for each risk that applies, actual or possible hazards are identified and an assessment made of:

- the nature of the hazard (e.g. dust, litter, type of visible emission);
- sensitive receptors (e.g. people, animals, property and anything else that could be affected by the hazard);
- pathways (i.e. how the hazard can get to a receptor);
- proposed measures to be adopted reduce risks;
- the probability of exposure (e.g. whether a risk is unlikely or highly likely);
- potential consequences (i.e. what harm could be caused) and
- an assessment of the overall risk following implementation of any identified mitigation measures.

6.1.3 Environment Agency guidance states that *“if you are applying for a bespoke permit but most of your activities are covered by standard rules, you only need to do a risk assessment for the activities or risks that are not covered by the generic risk assessment for those standard rules.”* On that basis, the risk assessment for Ladds Recycling Yard (presented in **Appendix H**) has been developed using the Environment Agency’s generic risk assessment for a Standard Rules SR2022 No.1 permit as a starting point and takes into account Environment Agency guidance on non-hazardous and inert waste: appropriate measures for permitted facilities¹ and the proposed physico-chemical treatment activity (soil washing).

7. Conclusions

- 7.1.1 The output of the site-specific risk assessment is presented in **Appendix H** including the mitigation measures proposed to reduce risks to identified receptors to acceptable levels. A Site-specific DEMP¹⁰ has been prepared given the increase in volume of material stored at the Site. Further bespoke risk assessments have not been prepared on the basis that the proposed amendments to the permit, including rationalisation of the waste codes, have not resulted in unacceptable risks requiring mitigation measures over and above those set out in the standard rules risk assessment.
- 7.1.2 In summary, residual risks associated with the proposed activities at the Site are considered to be low following implementation of the mitigation measures. Should Site conditions change, the findings of this risk assessment, including the mitigation measures, may need to be reviewed.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England. The probability result is only valid for properties above ground. All basement and cellar areas are considered to be at additional risk from high radon levels. If an underground room such as a cellar or basement makes up part of the living or working accommodation, the property should be tested regardless of Radon Affected Area status.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1975

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Cornwall & Isles Of Scilly

Published 1888

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2024

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Appendix H

Site Specific Risk Assessment

Data and information			Judgement				Action (by permitting)	
Source	Pathway	Harm	Likelihood of Hazard Affecting the Receptor	Overall Severity of Potential Consequences	Overall Risk Rating	Justification	Risk management	Residual risk
Receptor: Local Human Population								
Release of particulate matter (dust) and microorganisms (bioaerosols).	Dust and bioaerosols travel through the air and can be: - Inhaled or ingested; or - deposited on garden fruit and vegetables and then ingested.	There is a risk of dust and bioaerosols causing: - respiratory irritation and illness; or - gastro-intestinal illness.	Low	Medium	Medium	Permitted waste types include soils and other wastes which are likely to result in particulates when transferred and treated. However: - there is a low potential to produce bioaerosols; - there is potential for exposure to anyone living or working close to the Site (excluding operator and employees); and - there is potential for increased dust generation from permitted activities during prolonged dry periods for example summer months.	The prevailing wind direction is south-westerly. The Site is located to the south of a large industrial area, with industrial premises to the north screened by the railway embankment. There are few residential receptors in the vicinity of the Site. New residential properties are located circa 80 m north-east of the Site entrance, beyond the railway line, in an industrial area. Other residential properties in the vicinity of the Site are more than 220 m west / south-west (i.e. upwind based on prevailing wind direction). No complaints have been received in relation to dust from activities on-Site nor was dust identified as an issue during the most recent Environment Agency inspection. A Site-specific Dust & Emissions Management Plan (DEMP) has been prepared to manage and reduce the risk from dust emissions.	Low
Waste, Litter and Mud on Local Roads	Vehicles entering and leaving the Site risk causing: - nuisance; - loss of amenity; or - road traffic accidents.		Medium	Medium	Medium	There is a risk of creating unsafe road surfaces in wet weather. Furthermore local residents are often sensitive to mud on roads	The Site benefits from concrete hardstanding with other measures used on site to control dust/particulates including: - Site / process layout in relation to receptors. Stockpiles are generally located in the centre of the Site, away from off-site receptors within the constraints of the Site. - Site speed limit, no "idling" policy and minimisation of vehicle movements on-Site. A no idling policy is adopted, with designated traffic routes for lorries to minimise potential for tracking material from waste storage areas. - Minimising drop heights for waste. All waste deposition is undertaken in a manner to minimise the drop height. - Good housekeeping. The Site was described as clean, tidy and well organised during the most recent Environment Agency inspection. - Minimisation of waste storage heights and volumes on-Site. The proposed changes will increase the size of stockpiles on-site with the potential to increase the surface area over which particulates can be mobilised. Stockpiles to be managed as part of daily visual inspections by the Operator, including covering as required. Given the types of waste treated at the Site litter has not been a significant issue to date and this is not anticipated to change. Site staff to continue to conduct litter collections after windy weather on an as required basis to ensure the Site, including its boundaries, is kept clear of litter and rubbish irrespective of its source. In the event that emissions are not controlled, further measures will be considered as part of the DEMP. These may include site perimeter netting / micro netting, a wheel wash and water suppression with mist sprays.	Low
Odour	Odour travels through the air and can be inhaled.	Risk of: - nuisance; or - loss of amenity.	Low	Low	Low	Waste types accepted are unlikely to be odorous.	Permitted waste types identified to have low odour potential as part of standard rules assessment. Historically the Site has predominantly accepted hardcore and soil for recycling and this is planned to continue as part of the permit variation. The rationalising of the waste codes as part of the bespoke permit variation will reduce the odour potential further (e.g. waste code 02 02 02 shellfish shells from which the soft tissue or flesh has been removed).	Low
Noise & Vibration	Noise travels through the air and vibration through the ground.	Risk of: - nuisance; - loss of amenity for local residents and workplaces; - loss of sleep.	Medium	Medium	Medium	Local residents are often sensitive to noise and vibration. The permit allows waste crushing and screening activities along with operation of soil washing plant. The Site is located in an industrial area with no sensitive habitats (e.g. SSSIs) in the vicinity of the Site (see Magic Maps outputs in Appendix E). A local wildlife site (see mapping in Appendix F) is located 170 m south of the Site at its nearest point. No residential receptors are located in the vicinity of the Site (nearest residents 80 m north-east, beyond the railway line and greater than 200 m west / south-west of the Site). No complaints have been received to date relating to noise or vibrations.	A noise and vibration management plan has been developed to ensure emissions are free from noise and vibration at levels likely to cause pollution.	Low
Scavenging Animals and Birds	Animals and birds travel over land and through the air.	Risk of: - nuisance; - loss of amenity; or - harm to human health from waste carried off-site and from faeces.	Low	Low	Low	Permitted wastes are unlikely to attract scavenging animals and birds.	The regular throughput on-Site will reduce the period of time that waste remains unprocessed and the waste types accepted do not include materials (e.g. putrescible household waste, plastic and paper) identified as being at the greatest risk of pest infestation. Nature of wastes accepted to date is not to change and scavenging animals / birds has not been an issue thus far. Rationalisation of permitted waste codes (e.g. removal of 02 02 02 shellfish shells from which the soft tissue or flesh has been removed) further reduces the potential for scavenging animals and birds.	Low
Pests Such as Flies	Pests such as flies can travel through the air or over land.	Risk of: - nuisance; - loss of amenity; or - harm to human health.	Low	Low	Low	Permitted waste types are unlikely to attract pests, such as flies.	As above.	Low
Receptor: Local Human Population & Local Environment								
Flooding of the Site	Water can flood the Site during heavy or persistent rainfall events.	There is a risk of waste washed off-site contaminating buildings, gardens and natural habitats downstream.	Low	Medium	Low	Permitted waste types are non-hazardous and therefore the risk of contamination is not high.	The Site is located in Flood Zone 1 (see mapping in Appendix A) and has not been identified as route for surface water overland flow. Site has an Environmental Management System (EMS) which includes operational and maintenance requirements plus an accident management plan.	
Fire Risk	There is a risk of fire on Site from: - arson and, or vandalism; or - spontaneous combustion from uncontrolled decomposition. Fire can cause: - polluting materials (smoke or fumes) to travel through the air, water or over land; and - spillages and contaminated firewater by direct run-off from the site and through surface water drains and ditches.	Risk of: - respiratory irritation, illness and nuisance to the local population; - injury to staff, firefighters or arsonists and vandals; and - air, water or land pollution.	Medium	Low	Low	Permitted waste types do not include any flammable materials so a low magnitude risk is estimated.	The Site's EMS identifies and minimises risks of pollution, including those arising from operations, maintenance, accidents, incidents, non-conformances. The EMS includes measures to avoid fire outbreak and to control fires, including containment of fire waters.	Low

Data and information			Judgement				Action (by permitting)	
Source	Pathway	Harm	Likelihood of Hazard Affecting the Receptor	Overall Severity of Potential Consequences	Overall Risk Rating	Justification	Risk management	Residual risk
Receptor: Local Human Population, Livestock & Wildlife								
Litter on Surrounding Land and in Final Material	Litter can travel through the air and then be deposited on land.	Risks of: - nuisance; - loss of amenity; - harm to animal health; and - reduction in land bank values due to contamination.	Low	Low	Low	Permitted waste types are not likely to produce litter.	The Operator walks the Site perimeter fencing at least weekly, more frequently in summer, to inspect the condition of the fence line and pick up rubbish. The local wildlife site 170 m to the south of the Site is upwind of the prevailing wind direction.	Low
Gaining Unauthorised Access to Site	Risk of direct physical contact with all on-site hazards such as wastes, machinery and vehicles.	risk of causing injury to humans or livestock	Low	Low	Low	Permitted waste types are non-hazardous plus the Site's EMS includes procedures for worker and visitor safety.	The entrance to the Site is secured with gates (locked out of hours) with the boundary secured by a variety of fences and walls, along with the railway embankment to the north thereby restricting unauthorised access to the operational area (see photographs of the Site in Appendix B).	Low
Receptor: Surface Waters Close to and Downstream of Site								
Risk of Pollution Causing Acute Effects	There is a risk of pollution from spillage of liquids, leachate from waste, contaminated rainwater run-off from waste with high organic and ammonia content and suspended solids. Contamination can travel through direct run-off from Site over the land, surface water drains and ditches.	Risks include: - oxygen depletion; - fish kill; and - algal blooms.	Low	Low	Low	Permitted waste types do not include sludges or liquids and are non-hazardous. However there is potential for contaminated rainwater run-off from waste operations. Leachate may contain suspended solids, especially during periods of heavy rain.	No point source emissions to water are permitted, and the soil wash plant is to be a closed loop system. The nearest surface water feature is greater than 200 m from the Site. All waste is placed and treated on a concrete hardstanding (see photosheet in Appendix B). All liquids (e.g. fuels) must be in containers with secondary containment. Secondary containment must meet CIRIA C736 guidance. Remote containment also in place in form of wedge pit to the south-west.	Low
Risk of Pollution Causing Chronic Effects	- Liquid spills; - Leachate from waste; or - Contaminated rainwater run-off from waste. Contamination can travel by: - direct run-off from Site over the land, through surface water drains and ditches; and - indirect run-off through soil.	Risk of deterioration to water quality.	Low	Low	Low	Pollution is likely to be detected quickly and the effects are temporary and reversible.	As above.	Low
Receptor: Water Abstracted from a Watercourse								
Risks relate to watercourses downstream of Ladds Yard and to water for agricultural or potable use.	- Liquid spills; - Leachate from waste; or - Contaminated rainwater run-off from waste.	There is a risk of contaminants travelling through direct run-off from the Site across ground surface, via surface water drains and ditches and finally through abstraction. This could have acute effects and cause the closure of abstraction intakes.	Low	Low	Low	Potential for contaminated rainwater run-off from waste operations carried out in the open, especially during heavy rain.	As above.	Low
Receptor: Groundwater								
Risks to groundwater	- Liquid spills; - Leachate from waste; or - Contaminated rainwater run-off from waste.	There is a risk of contaminants travelling through soil and groundwater which can then be abstracted from a borehole. This could have a chronic effect resulting in the groundwater requiring treatment or causing closure of a borehole.	Low	Low	Low	Potential for contaminated rainwater run-off or leachate from waste operations, especially during heavy rain. The consequence is based on the possibility of pollution not being detected for a long time.	To manage the risk the following actions must be taken: - The soil wash plant must be a closed loop system. - All liquids must be in containers with secondary containment. Secondary containment must meet CIRIA C736 guidance. - All waste storage and treatment to take place on concrete hardstanding.	Low
Receptor: Protected Sites								
Protected sites (as per list below) include: - National Parks and Areas of Outstanding Natural Beauty; - Marine Conservation Zones; - Sites of Special Scientific Interest; - Special Areas of Conservation; - Special Protection Areas; and - Ramsar wetland sites. Protected sites can be at risk from any source and by any pathway.		Risks include: - nutrient enrichment; - leachate; - contaminated surface water run off; - smothering; - disturbance; and - predation.	Low	Low	Low	Treating waste to produce soils, soil substitutes or aggregates, may cause harm to and deterioration of nature conservation sites.	No nature conservation sites located within the vicinity of the Site (see mapping in Appendix A and Appendix E). A local wildlife site is located 170 m south of the Site at its nearest point; this Site (see mapping in Appendix F) is located upwind of the prevailing wind direction and at a higher elevation than the Site.	Low
