1. SITE DETAILS

1.1. Context and Objectives of Site Condition Report

1.1.1. Environmental Compliance Limited ("ECL") has been appointed by MorGen Energy UK Limited ("MorGen") to prepare an Application Site Condition Report ("ASCR") to form part of the Environmental Permit ("EP") application for the proposed Hydrogen ("H_2") Plant, hereafter referred to as "the Installation", located on Plot 1C, the Wilton Industrial Estate, Redcar, TS10 4RF.

1.1.2. The ASCR has been produced using the Environment Agency ("EA") provided template, 'Guidance for applicants H5 Site condition report – guidance and templates' (Version 3.0, updated May 2013[1]). The relevant sections required from the European Union ("EU") Industrial Emissions Directive ("IED") 2010/75/EU[2] have also been incorporated.

1.1.3. The aim of the ASCR is to describe the condition of the land at the site and, in particular, to identify any substance in, on, or under the land that may present a pollution risk.

1.1.4. The ASCR, therefore, sets out the initial (i.e. current) condition of the site and takes into account any pollution incidents that may have occurred at the site, and details of any measures put into place to mitigate the effects of any such incidents. It serves two main purposes:

- firstly, it will act as a reference point, along with operating records, for measuring any deterioration of the site whilst operating under the permit (on surrender of the permit, another site report must be prepared, identifying any changes to the condition of the site from that described in the original report); and
- secondly, the ASCR will give information on the physical attributes and vulnerability of the site; it will assist in understanding the environmental setting of the site, and understanding the nature, extent and behaviour of any contaminants that may be present; local hydrology, hydrogeology, geology, and general setting are taken into account.

[2] European Union Industrial Emissions Directive. Available online at: https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:32010L0075

1.2. The Applicant

1.2.1. Morgen are developers of large-scale green hydrogen ecosystems. Founded in 2021 in Switzerland, Morgen delivers projects from conception to construction, and from production to consumption.

1.2.2. Morgen builds and operates the infrastructure needed to establish green hydrogen as a future core energy source, evolving the energy system to become more sustainable and resilient.

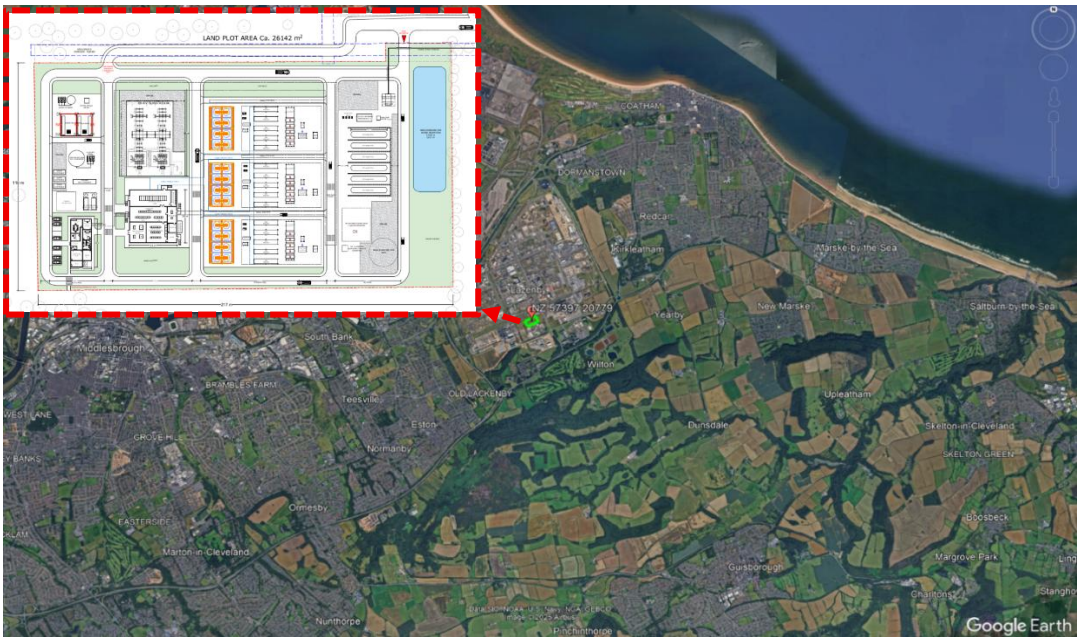

1.2.3. Morgen Energy was incorporated in 2025 under company number 16542901.

1.3. Site Location

1.3.1. The Installation is located at Wilton Industrial Estate and is centred on national grid reference ("NGR") NZ 57430 20790. The H_2 plant will be constructed on an area of cleared grassland, bordered by a mix of trees, hedges and bushes.

1.3.2. The location of the H_2 Plant and setting is provided in Figure 1 and covers an area of approximately 3 hectares ("Ha"). Detailed drawings may be found in Section 3 of the EP application submission.

Figure 1: Indicative H_2 Plant Location

1.3.3. In general, within 2.5km of the EP boundary, the surrounding land use is made up of industrial and commercial activities to the north and northwest, residential areas to the northeast and west and green space (comprising a golf course, agricultural land and woodland) to the south and southeast.

1.3.4. The towns of Grangetown and Redcar are located approximately 1.8km to the west and 2.5km northeast of the EP boundary, respectively and the villages of Lazenby and Old Lackenby are located approximately 650m south and 1.6km southwest of the EP boundary, respectively. Middlesbrough town centre lies approximately 7.5km west of the Installation.

1.3.5. At their approximate nearest points, the A174 and A1053 lie 770m south and 1.25km southwest of the EP boundary, respectively, and the River Tees lies circa 4km to the northwest.

2. CONDITION OF THE LAND AT PERMIT ISSUE

2.1. Environmental Setting

Geology

2.1.1. The British Geological Survey ("BGS") Geoindex Onshore mapping tool [3] indicates superficial deposits underlying the site and surrounding land comprise of Devensian Till (Diamicton) which formed between 116 and 11.8 thousand years ago during the Quaternary period. The permeability of the superficial deposits is described as generally low.

2.1.2. The BGS Geology of Britain Viewer indicates the bedrock is Redcar Mudstone Group, which formed between 201.3 and 182.7 million years ago during the Early Jurassic period. The permeability of the bedrock is described as very low to low.

2.1.3. The BGS Estimated Soil Chemistry average concentration values, as reported within the Envirocheck Report contained in Appendix I, are as follows:

- arsenic – <15 mg/kg;
- cadmium – <1.8 mg/kg;
- chromium – 60 – 90 mg/kg;
- lead – <100 mg/kg; and
- nickel – 15-30 mg/kg

2.1.4. According to the Mining Remediation Authority Map Viewer[4], there is no indication of mining activity at the Installation.

2.1.5. According to the Radon Affected Area[5] mapping tool for the UK produced by Public Health England ("PHE"), the Installation is located in an area with the lowest band of radon potential with less than 1% of properties above the action level.

Hydrogeology

2.1.6. The Multi Agency Geographic Information for the Countryside[6] ("MAGIC") online tool and the Envirocheck Report (see Appendix I) indicate that the Installation is located on a Secondary Aquifer (undifferentiated) and is located within a low groundwater vulnerability area.

2.1.7. There are no groundwater abstraction licences recorded within 1.5km of the Installation, with the nearest sited approximately 1.9km north-northeast of the Installation (refer to the Envirocheck report in Appendix I for further details).

2.1.8. The MAGIC online tool indicates that the Installation is not within a Source Protection Zone ("SPZ").

[3] British Geological Survey GeoIndex Onshore, available online at: https://mapapps2.bgs.ac.uk/geoindex/home.html
[4] Mining Remediation Authority Map Viewer, available online at: https://datamine-cauk.hub.arcgis.com/
[5] Public Health England. Radon Affected Areas Mapping Tool, available online at: https://www.ukradon.org/information/ukmaps
[6] Multi Agency Geographic Information for the Countryside tool, available online at: https://magic.defra.gov.uk/MagicMap.aspx

Surface Waters

2.1.9. The Envirocheck Report, which is contained in Appendix I of this document, notes the closest surface water feature to be within the Installation boundary. From a review of satellite imagery and maps of the area, it is considered that this is likely an existing drainage channel (with the land currently cleared grassland). It is anticipated the existing surface water features will be replaced by the Installation's site surfacing and drainage infrastructure. In addition, there are small-scale reservoirs sited approximately 1.1km to the southeast of the EP boundary.

2.1.10. The nearest major water course is the River Tees, located approximately 4km to the northwest of the Installation. The River Tees is heavily modified and stretches approximately 137km in length and flows from the North Pennines eastwards to meet the North Sea between Hartlepool and Redcar. The Tees waterbody is classified as being of moderate ecological potential and possesses a poor chemical status[7].

2.1.11. As shown on the EA's mapping service for flood risk from rivers or the sea[8], the Installation is not covered by a flood risk category for rivers or the sea and is therefore deemed to have a very low probability of flooding (meaning that the potential of flooding is less than 0.1% each year).

2.1.12. As shown on the EA's mapping service for flood risk from surface waters[8], the majority of the Installation is not covered by a flood risk category for surface waters (meaning that the potential of flooding is less than 0.1% each year) or it is covered by a low chance of flooding (meaning that the potential of flooding is between 0.1% to 1% each year). It should be noted that there are also areas (notably the northeasterly portion of the Installation) that possess a high flood risk (meaning that the potential of flooding from surface water is greater than 3.3%).

2.1.13. It is understood that as the current surface water flood risk for the area occupied by the Installation is based on its current undeveloped state, it is anticipated the overall surface water flood risk will be reduced via the Installation's site surfacing and drainage infrastructure.

2.1.14. Figures 2 and 3 have been provided to reproduce the information displayed via the EA's mapping service for rivers and the sea and for surface waters, respectively. In Figures 2 and 3, the approximate location of the Installation has been outlined in red.

[8] EA's Long Term Flood Risk Map, available online at: https://check-long-term-flood-risk.service.gov.uk/map

Figure 2: Long Term Flood Risk Map – Rivers and the Sea

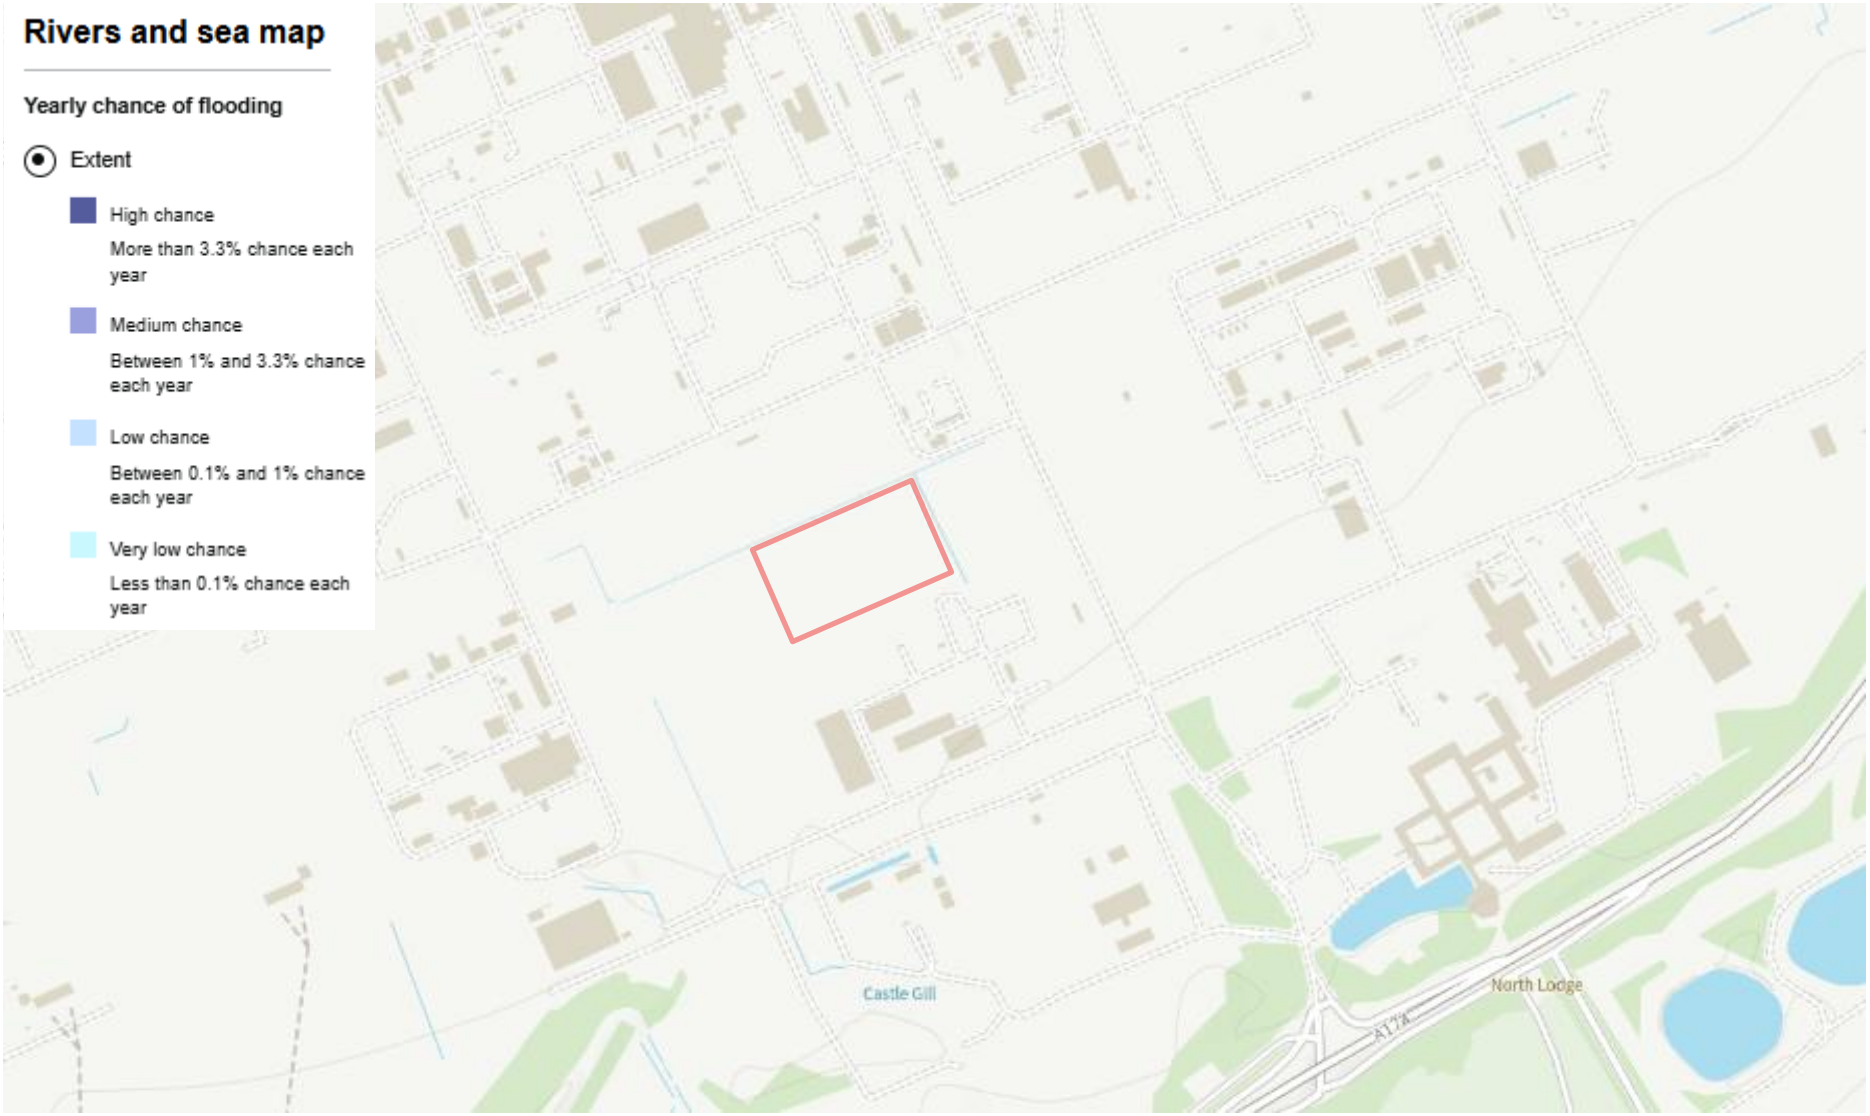

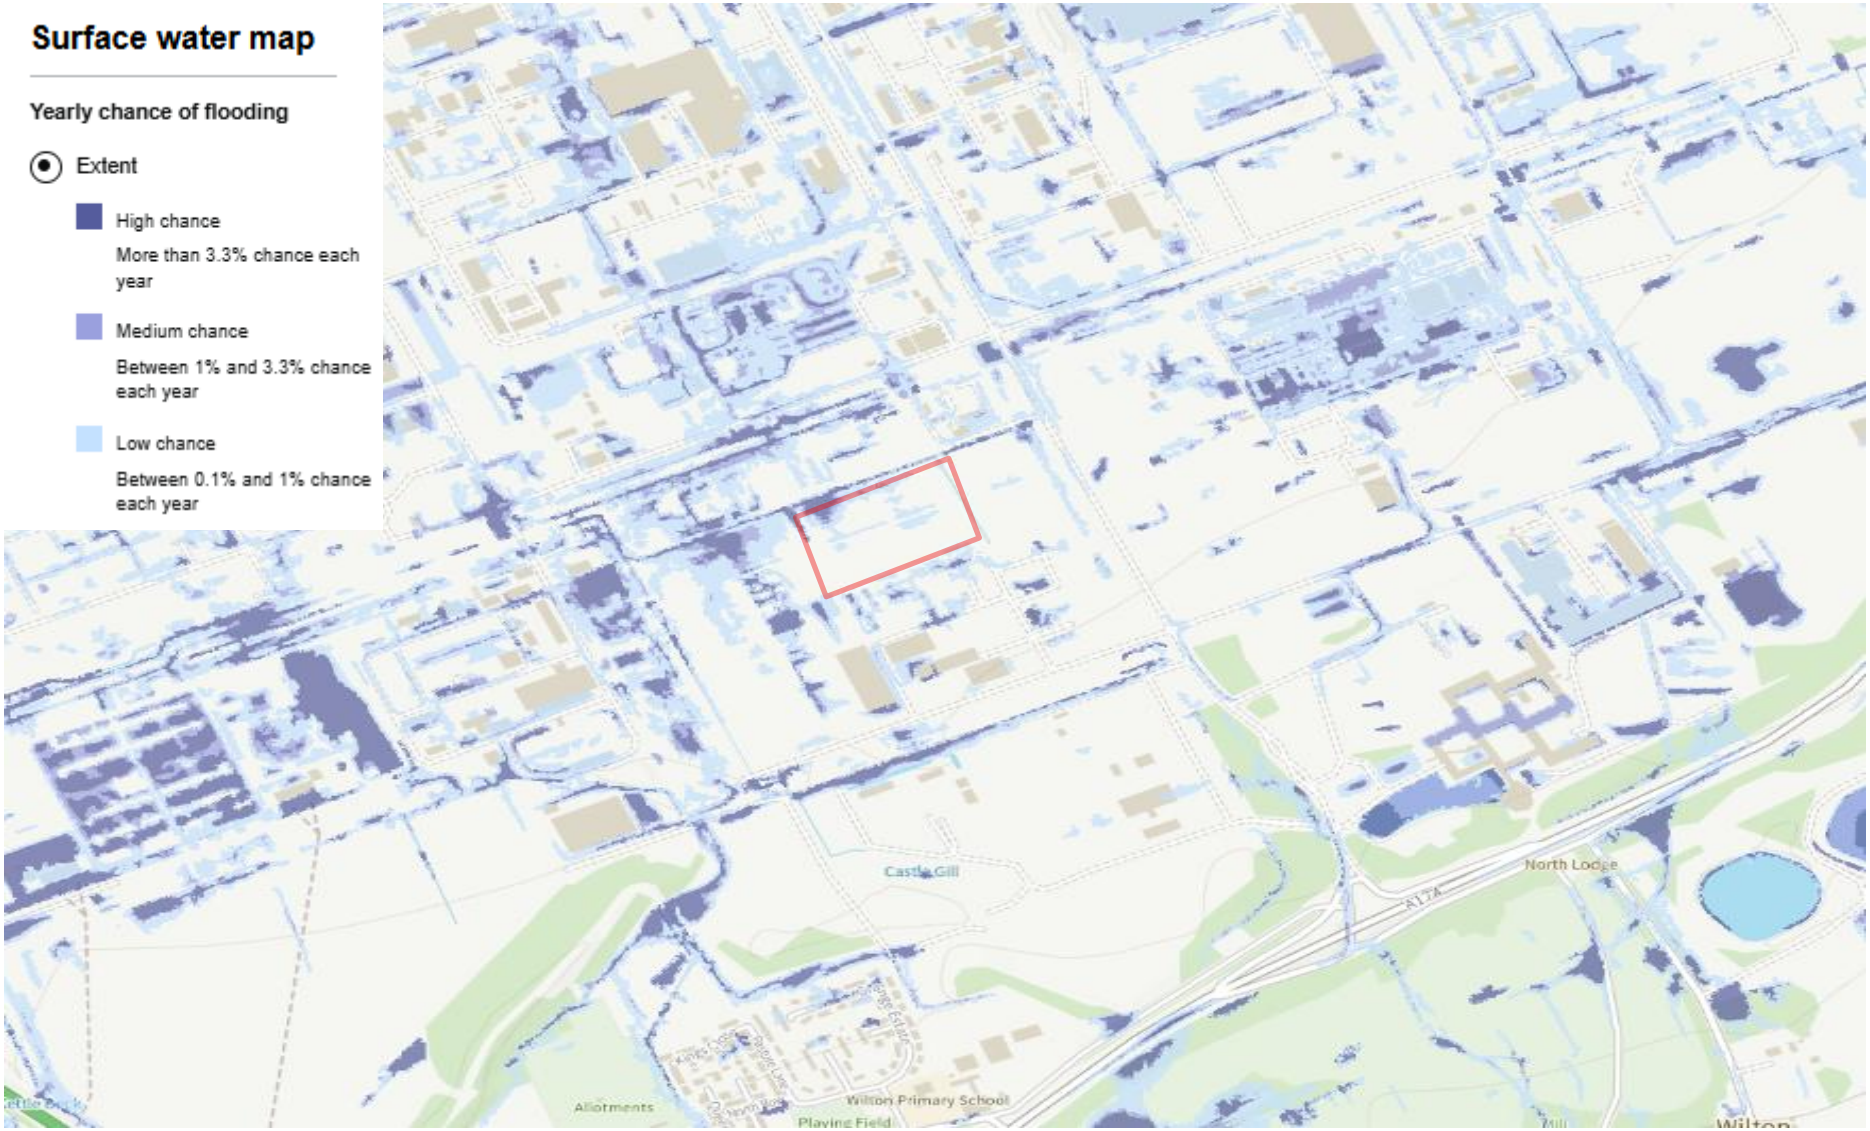

Figure 3: Long Term Flood Risk Map – Surface Water

2.2. Pollution History

Historic and Existing Activities

2.2.1. A review of the Ordnance Survey ("OS") maps (contained within the Envirocheck Report – Appendix I) from 1857 to 2025 has been undertaken for the Installation. The findings are presented in Table 1.

2.2.2. It is not the purpose of this section to provide a comprehensive account of development history, but only to detail those factors that are or could be relevant to the potentially contaminative history of the site and surrounding areas.

Table 1: Historical Review

Date	Scale	The Installation	Surrounding Area
1857	1:10,560	Open / agricultural land.	The surrounding land is predominantly agricultural. Wilton and Lazenby villages are located approximately 800m southeast and southwest, respectively with main roads connecting these.
1894	1:2,500	No change observed.	No change observed.
1895	1:10,560	No change observed.	No significant changes.
1915	1:2,500	No change observed.	No change observed.
1919	1:10,560	No change observed.	No significant changes.
1929	1:2,500	No change observed.	No change observed.
1953	1:10,000	No change observed.	Expansion to the villages of Wilton and Lazenby appear to have taken place. Industrial units as part of Wilton Works now present, sited circa 500m to the north of the Installation.
1955 - 1971	1:2,500	No change observed.	No change observed.
1975 and 1976	1:10,000	No change observed.	Significant development of Wilton Works to the northwest, north and northeast of the Installation, with a mixture of large and smaller industrial buildings occupying the land. A commercial building now occupies land circa 700m to the southwest of the EP boundary. Major road (A1053) now apparent approximately 1.2km southwest of the Installation.
1982	1:2,500	No change observed.	Wilton Works industrial activities have now expanded circa 80m south of the Installation, comprising a mixture of industrial units and storage tanks.
1981 - 1985	1:10,000	Drainage channel running west to east along the centre portion of the Installation.	Further expansion to Wilton Works to the northwest, north, northwest and east of the Installation (of particular note is a power station now present approximately 500m to the east). Reservoirs now apparent circa 1.1km southeast of the Installation.

Table 1: Historical Review (cont.)

Date	Scale	The Installation	Surrounding Area
1991 - 1992	1:10,000	No change observed.	Expansion to the commercial / industrial activities sited approximately 650m east of the EP boundary.
2000	1:10,000	No change observed.	Further development of the Wilton Works, with expansion to the activities immediately south of the EP boundary and an additional power station now present circa 600m to the west-southwest of the Installation.
2006	1:10,000	No change observed.	Building infrastructure immediately south of the EP boundary appears to have been demolished / removed.
2025	1:10,000	No change observed.	The power station circa 600m to the west-southwest of the Installation has been decommissioned and is no longer present. A new industrial activity, made up of a series of buildings and tanks, can be observed approximately 300m to the west-southwest

Waste Sites Including Landfill Sites

2.2.3. According to the Envirocheck Report (see Appendix I), there are no BGS Recorded Landfill Sites or historical landfill sites within 1km of the Installation.

2.2.4. The Envirocheck Report states that there are or have been licensed waste management facilities within 1km of the Installation, namely:

- ICI Chemicals & Polymers Limited which was issued various licences on 20/10/1978 for industrial waste landfills, with the closest located approximately 460m south of the EP boundary. The licences either state 'closure' or 'expired';
- IEX Technologies Limited which was issued a licence on 05/11/2024 for chemical treatment. The nearest point of the site's boundary is located approximately 760m east of the EP boundary;
- Biffa Waste Services Limited was issued a licence on 14/09/2004 for material recycling treatment facilities. The nearest point of the site's boundary is located approximately 800m northwest of the EP boundary; and
- Power Minerals Limited was issued a licence on 26/11/2019 for physico-chemical treatment facilities. The nearest point of the site's boundary is located approximately 900m northwest of the EP boundary.

Pollution Incidents

2.2.5. The Envirocheck Report (see Appendix I) for the Installation reveals one pollution incident to controlled waters within 1km of the Installation, which occurred on 09/10/1995, was described as 'other chemicals' as the pollutant and was a Category 3 – Minor Incident, with no fish killed. The receiving water was the Tees Saline Estuary, with the approximate location of the release 970m north of the EP boundary.

2.2.6. In addition, there are numerous substantiated pollution incidents listed in the Envirocheck Report. The nearest (circa 440m southwest of the Installation) and most recent (03/08/2010) being to air (chemical odour), with no impacts reported for water or land.

Potential Pollution Impacts

2.2.7. The following potential sources of contamination were identified from the historic map review:

- On-site – Installation has been open or agricultural land with no obvious evidence of any significant potential for existing contamination.
- Off-site – presence of contaminants including petroleum hydrocarbons and polycyclic aromatic hydrocarbons is considered likely (associated with use of fuels and oils). There is also the potential for asbestos and polychlorinated biphenyls contamination from former and current industrial and commercial activities in the surrounding area.

2.3. Site Walkover Survey

2.3.1. The EP boundary is illustrated on the Site Location Plan which may be found in Section 3 of the EP application submission.

2.3.2. Images taken during a site walkover survey of the land occupied by the Installation are provided as Figures 4 to 6. These present an overview of the condition of the site prior to development.

Figure 4: General Site Character – Eastern Installation Boundary Looking North

Figure 5: General Site Character – Southern Installation Boundary Looking West

Figure 6: General Site Character – Southern Installation Boundary Looking Northeast

3. IED Baseline Site Condition Report

3.1. Introduction

3.1.1. This baseline risk assessment has been undertaken in accordance with the 'European Commission ("EC") guidance concerning baseline reports under Article 22(2) of Directive 2010/75/EU on industrial emissions' (May 2014).

3.1.2. This section considers the contamination risk associated with hazardous substances used produced and/or released by the Installation where hazardous substances are defined as substances or mixtures defined in Article 3 of European Regulation (EC) No 1272/2008 of the European Parliament and of the Council of 16 December 2008 on Classification, Labelling, and Packaging of substances and mixtures[9].

3.1.3. The Industrial Emissions Directive ("IED") requires an assessment to be carried out for all hazardous substances used, produced, or released within the Installation. Stages 1-3 must be completed to assess if a baseline report is required. The stages are as follows:

- Stage 1 – identify hazardous substances on site;
- Stage 2 – identify relevant hazardous substances;
- Stage 3 – assessment of site-specific pollution possibility.

3.2. Stage 1 - Hazardous Substances Used, Produced and/or Released at the Installation

3.2.1. Following a review of the raw materials to be used at the Installation (see Section 5.3. of the EPTR, which may be found in Section 4 of the EP application submission), the following hazardous substances are expected to be used, produced, and/or released at the Installation:

- polyfluoroalkyl substances ("PFAS") – used during the electrolysis process;
- diesel – fuel for the backup emergency generator;
- transformer oil;
- ethylene glycol – antifreeze; and
- refrigerant – cooling the H_2 gas prior to dehydration.

3.2.2. All potentially polluting substances are bunded and stored on impermeable hardstanding.

3.2.3. It should be noted that the membranes used in the electrolysis H_2 production process are made from various materials including fluoropolymers, which belong to the per- and PFAS family.

3.2.4. The PFAS are only released in very limited amounts to the demineralised water passing through the electrolysis membrane. Consequently, it is essential for the process that it is removed from the water before the water is re-used for electrolysis.

[9] Regulation (EC) No 1272/2008 of the European Parliament and of the Council, available online at: https://www.legislation.gov.uk/eur/2008/1272/article/3

3.2.5. Therefore, the PFAS content is removed from the water before it is sent through the electrolysis membrane again. The process is monitored by constantly measuring the conductivity of the water (i.e. ensuring that the water is strongly de-ionised). Consequently, the derived PFAS only accumulates in the resins that purify the water as a loop in the process.

3.3. Stage 2 - Relevant Hazardous Substances

3.3.1. With regards to the IED, RHS can be defined as those substances or mixture defined within Article 3 of Regulation (EC) No 1272/2008, which, due to their hazardousness, persistence, mobility, biodegradability, and other characteristics, have the potential to contaminate soil or groundwater and are used, produced, and/or released by the Installation.

3.3.2. All RHS would be capable of contaminating soil and/or groundwater if there were no mitigation measures implemented, or if there was a contaminant pathway present at the Installation (see Table 2).

3.3.3. As PFAS are only released from the membranes used in the electrolysis H_2 production process in very small quantities and kept in a closed loop, it is not considered an RHS. Similarly, as the refrigerant is a gas (and therefore is unlikely to possess the potential to contaminant soil and / or groundwater) it has also been discounted as an RHS.

Table 2: Determination of Relevant Hazardous Substances

Substance	Hazardous Ingredients according to 1272/2008	Hazard Properties	Persistence	Physical State and Mobility	Biodegradability	RHS
Diesel fuel	Alkanes, C10-20 branched and linear	Flammable liquid and vapour Causes skin irritation Harmful if inhaled Suspected of causing cancer Toxic to aquatic life with long lasting effects	May accumulate in sediments	Liquid Immiscible in water Viscosity 4.8mm^2/s @ 20^{o}C	Unlikely to undergo appreciable degradation through hydrolysis or photolysis	Yes
Transformer oil	Mineral oils, Alkanes C10 - 20 branched and linear	May be fatal if swallowed and enters airways Toxic to aquatic life with long lasting effects	Bioaccumulation is unlikely to be significant because of the low water-solubility of this product	Liquid Non-volatile and insoluble in water – will spread on the water surface	Not considered readily biodegradable, albeit the major constituents are expected to ultimately biodegrade	Yes
Ethylene glycol	Ethylene Glycol	Harmful if swallowed May cause damage to organs through prolonged or repeated exposure	No	Liquid Colourless No odour data Miscible Stable under recommended storage conditions	Yes	Yes

3.4. Stage 3 - Assessment of the Site-Specific Pollution Possibility

3.4.1. The identified RHSs are considered in reference to the Installation to establish whether their release may provide a pollution risk, taking particular account of; the quantities of each RHS, how and where they are stored, transported and used.

3.4.2. Their release may represent a singular emission or an accumulation of multiple emissions.

3.4.3. Emissions may occur under the following circumstances:

- planned emissions,
- accidents and/or incidents, and
- routine operations.

3.4.4. The only planned emissions at the Installation are from the H_2 and oxygen ("O_2") vents to atmosphere. In addition, nitrogen is used very occasionally for purging purposes and in very small amounts.

3.4.5. It should be noted that the H_2 vents are located at a suitable distance from the O_2 vents to minimise fire and explosion risk. In addition, there are strict controls in place to ensure that in the event of an emergency, where both H_2 and O_2 have to be vented at the same time (e.g. emergency shut down), the H_2 is vented at a safe distance from the O_2 to avoid the risk of mixing and ignition.

3.4.6. As there are no planned emissions to land or groundwater, these would be limited to accidents or incidents.

3.4.7. Table 3 discusses the overall pollution risk when considering the on-site pollution prevention measures.

Table 3: Relevant Hazardous Substances Pollution Risk

Relevant RHS	Receptors	Pathway	Pollution Prevention and Risk Mitigation	Circumstances under which emissions may occur	Probability of Exposure	Overall Risk
Diesel Transformer oil Ethylene glycol	Ground, soil and surface waters	Overland flow/via drainage network	The storage tanks will be double walled and internally bunded or located within a sealed bund with a capacity of 110% of the total storage volume. Deliveries will be supervised by suitably trained personnel in areas isolated from the drainage network. In addition, the combined drainage network for the Installation will benefit from an interceptor and penstock valve to help minimise and control any pollution leaving the site. All employees will be suitably trained in the Site spill response procedure and spill kits will be strategically located throughout the Site. Routine inspection and maintenance of site surfacing and bund integrity will be undertaken in line with the Installation's Environmental Management System ("EMS") to observe any spillages and ensure any remedial action required can be undertaken immediately.	Delivery to Site Transfer from delivery vehicle to storage area	Low with appropriate control measures in place	Not Significant

3.5. Requirement for Intrusive Site Investigation

3.5.1. Following completion of Stages 1-3 of the baseline assessment, it has been determined that the RHSs which will be used, stored and produced throughout operations at the Installation do not pose an overall significant risk.

3.5.2. The extent and condition of the site infrastructure, the enclosed equipment and bunded storage tanks, the arrangement of the drainage network and the use of appropriate control measures will prevent any contamination from occurring as a result of the proposed activities.

3.5.3. Taking both the history of the Installation's land use (i.e. being located on open green / agricultural land for at least the last 168 years, when looking at the historical map records) and the recorded pollution incidents in the vicinity of the Installation into consideration, the potential for on-site pollution to have occurred is considered to be low. However, to ensure any legacy of contamination has been accounted for, an intrusive site investigation is being undertaken to establish the baseline conditions.

4. PERMITTED ACTIVITIES

4.1. Installation Activities

4.1.1. The proposed Schedule 1 Activity under the Environmental Permitting (England and Wales) Regulations 2016 as amended ("EP Regulations") is detailed in Table 4.

Table 4: Proposed Schedule 1 Activities

Schedule 1 Activity	Description of Specified Activity	Limits of Specified Activity
S4.2 A(1) (a) (i)	Production of hydrogen gas	Electrolysis of water to produce hydrogen and oxygen, and off site transfer of hydrogen gas via pipeline.

4.1.2. A 60MW H_2 generation plant will be installed within an area of approximately 3 hectares. The H_2 Plant will be able to generate a maximum of 21 tonnes of H_2 a day. A maximum of 1.8 tonnes of H_2 would be stored on site at any one time.

4.1.3. The H_2 Plant is designed to operate 24/7, however will operate at lower loads during peak electricity prices. Occasionally the plant may shut down for a few hours or days. Planned maintenance will occur for approximately 2 weeks every year. Consequently, the H_2 Plant is expected to be operational for 6,000 hours.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England. The probability result is only valid for properties above ground. All basement and cellar areas are considered to be at additional risk from high radon levels. If an underground room such as a cellar or basement makes up part of the living or working accommodation, the property should be tested regardless of Radon Affected Area status.

LANDMARK INFORMATION GROUP®

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

LANDMARK INFORMATION GROUP®

Yorkshire

Published 1857

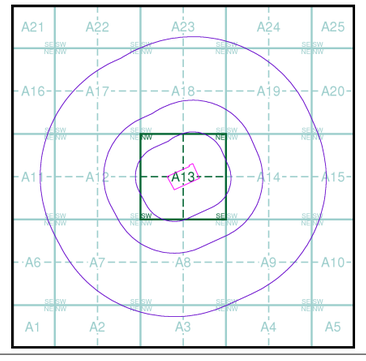

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Middlesbrough

Published 1975

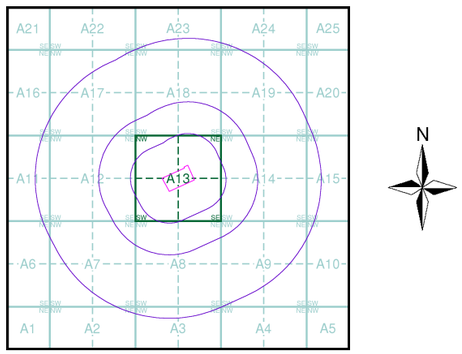

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.
They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

Ordnance Survey Plan

Published 1976

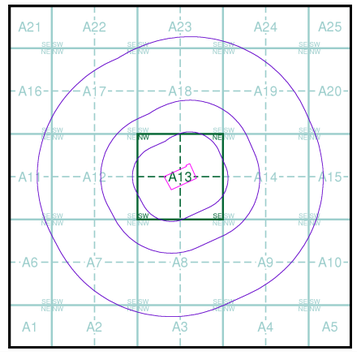

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

VectorMap Local

Published 2025

Source map scale - 1:10,000

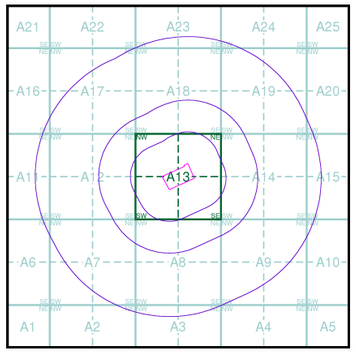

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Supply of Unpublished Survey Information

Published 1973 - 1974

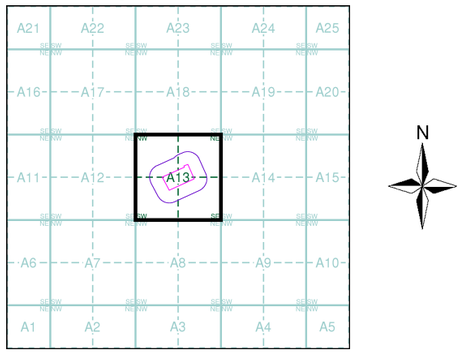

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1981

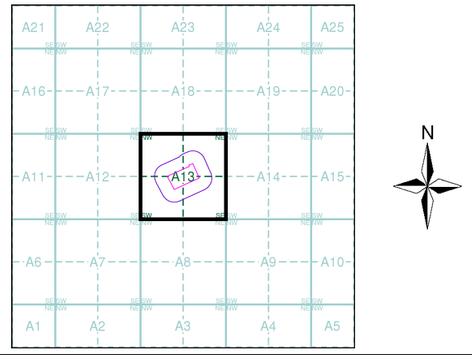

Source map scale - 1:2,500

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

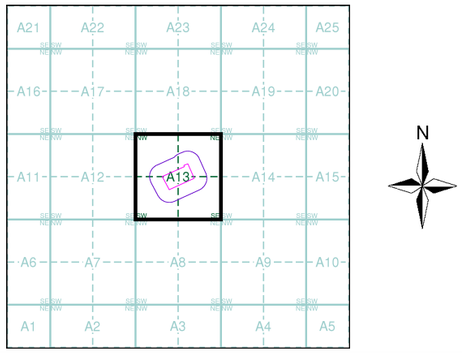

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.
