## Introduction

The existing weir at is to be raised by 300 mm to increase the storage capacity of the reservoir. An assessment of the storage capacity at the new top water level (TWL) has been carried out by MMB and is detailed in this technical note.

## Volume Assessment

Three different sources have been reviewed to determine the existing surface area and storage volume at existing TWL. A summary of the findings is shown in Table 1.

Table 1 - Surface area and reservoir storage volume review

| Source | Surface area at TWL $\left(\mathbf{m}^{\mathbf{2}}\right)$ | Reservoir storage volume at TWL $\left(\mathbf{m}^{\mathbf{3}}\right)$ | Notes |
| :--- | :--- | :--- | :--- |
|  | S10 Inspection $1,390,000$ $12,000,000$ <br> Report August 2011   |  |  |
|  | Wave Surcharge | $1,390,000$ | N/A |

The existing surface area will be taken as $1,320,000 \mathrm{~m}^{2}$ from the most up to date source (the Flood Study from November 2014) which refers to a 2014 topographical survey. The reservoir storage volume was not referenced in the Flood Study, therefore $12,000,000 \mathrm{~m}^{3}$ will be used.

## Assumptions

The volume assessment is based on the following assumptions:

- The reservoir surface area at existing TWL is $1,320,000 \mathrm{~m}^{2}$

[^0]- The reservoir stores $12,000,000 \mathrm{~m}^{3}$ at existing TWL
- The slope angle of the reservoir banks is $1: 1(\mathrm{~V}: \mathrm{H})^{*}$
*Sensitivity analysis has been carried out to assess the impact of the bank angle on the increase in storage capacity. Assuming a $1: 1(\mathrm{~V}: \mathrm{H})$, the additional storage volume around the perimeter is $207 \mathrm{~m}^{3}(0.05 \%$ of the volume increase) and a $1: 2(\mathrm{~V}: \mathrm{H})$ additional storage equates to $414 \mathrm{~m}^{3}(0.1 \%$ of the volume increase). The bank angle therefore has negligible impact on overall storage volume. The island has therefore been ignored for this assessment as change in volume will be negligible.

The results of the volume assessment have been summarised in Table 2.

Table 2 - Surface area and reservoir volume at existing and new TWL

| Top Water Level (mAD) | Surface area at TWL $\left(\mathbf{m}^{2}\right)$ | Reservoir storage volume at TWL $\left(\mathbf{m}^{\mathbf{3}}\right)$ |
| :--- | :--- | :--- |
| 180.57 (existing) | $1,320,000$ | $12,000,000$ |
| 180.87 (new) | $1,321,380$ | $12,396,207$ |

## Summary

In summary, the increased storage capacity resulting from raising the weir by 300 mm is approximately $396,207 \mathrm{~m}^{3}$, bringing the total storage capacity up to approximately $12,396,207 \mathrm{~m}^{3}$.
