

WORK INSTRUCTION W.I. EMS 22 V1

ROADWAY & HARDSTANDING INSPECTION PROCEDURE

All concrete and tarmac roadways and storage areas are to be checked annually to ensure that they are impervious to liquids and not damaged using site plan 1.1.4. as a guide.

- The check should identify any areas which are cracked or sunk and which will result in liquids including rainwater permeating into ground.
- This includes ensuring that sealed construction joints on concrete areas are sound.
- The location of the damage requiring repair action should be noted on a copy of the site plan (see site plan 1.1.4.) in order to assist if others have to carry out the follow up measures.
- These annual inspections should also be recorded on the Maintenance Supervisor Environmental Inspection Actions Record EMS F2 sheet 2
- In the event that areas are found to be porous, a repair schedule will be implemented.
