

# Appendix H-3 –Air Dispersion Modelling

## Results

### Introduction

The predicted changes in NO<sub>2</sub> and PM<sub>10</sub> concentrations from the assessment of the Scheme are presented for all selected worst-case receptors. Predicted NO<sub>x</sub> concentrations are also presented for ecological designated sites.

### Modelled Results

Table 1 and Table 2 below present the modelled annual NO<sub>2</sub> and PM<sub>10</sub> concentrations, and modelled NO<sub>x</sub> concentrations in correspondence of relevant ecological receptors, for both the Base, DM and DS scenarios, highlighting out any exceedances of the applicable AQS Objectives. The magnitude of impacts has also been defined and presented accordingly.

Figure 1 shows the human and ecological receptors considered in the assessment of the proposed Scheme. Figure 2 indicates the verified modelled results within 200 m of the proposed Scheme for the Base, Do Minimum (DM) and Do-Something (DS) scenarios.

Figure 3 and Figure 4 presents the overall NO<sub>2</sub> and PM<sub>10</sub> concentrations significance change within 200 m of the proposed Scheme. Figures indicating the magnitude change at each considered receptor (as provided in Table 1) is presented within the main body of the report. and the magnitude of impacts in correspondence of each receptor.
